APPENDIX B

SCOPE OF WORK

Revision #1 Dated 84 Aug 27

84 JUN 26

INSTALLATION RESTORATION PROGRAM*
Phase II Field Evaluation
Bergstrom AFB TX

I. Description of Work

The purpose of this task is to determine if environmental contamination has resulted from waste disposal practices, fuel spills and fire training activities at Bergstrom AFB TX; to provide estimates of the magnitude and extent of contamination, should contamination be found; to identify potential environmental consequences of migrating pollutants; to identify any additional investigations and their attendant costs necessary to properly evaluate the magnitude, extent, and direction of movement of discovered contaminants.

Ambient air monitoring of hazardous and/or toxic material for the protection of contractor and Air Force personnel shall be accomplished when necessary, especially during the drilling operation.

The presurvey report (mailed under separate cover) and Phase I IRP report (mailed under separate cover) incorporated background and description of the sites for this task. To accomplish the survey effort, the contractor shall take the following steps:

A. General

1. Determine the aerial extent of each site by reviewing available aerial photos of the base, both historical and the most recent panchromatic and infrared, and by field reconnaissance.

2. Locations where surface water, sediment, and core sample are collected shall be marked with a permanent marker, and the location recorded on a site map.

3. A total of six monitoring wells shall be installed. The exact location of the wells shall be determined in the field.

4. Ground-water monitoring wells shall be completed to a depth of at least 10 feet below the average water table surface. All wells shall be developed, water levels measured, and locations surveyed and recorded on a site map.

5. Ground-water monitoring wells shall comply with U.S. EPA publication 330/9-81-002 NEIC Manual for Groundwater/Subsurface Investigations at Hazardous Waste Sites, and State of Texas requirements for monitoring well installation. Only screw type joints shall be used. Gine fittings are not permitted.

*Highlights of modification are underscored

6. All water samples shall be analyzed on site by the contractor for pH, temperature, and specific conductance. Sampling, maximum holding time, and preservation of samples shall comply strictly with the following references: Standard Methods for the Examination of Water and Wastewater, 15th Ed. (1980), pp 35-42; ASTM, Part 31, pp 72-82, (1976), Method D-3370; and Methods for Chemical Analysis of Waters and Wastes, EPA Manual 600/4-79-020, pp xiii to xix (1979). All water samples shall be analyzed using minimum detection levels, as specified in Attachment 1.

7. Field data collected for each site shall be plotted and mapped. The nature of contamination and the magnitude and potential for contaminant flow within each site to receiving streams and ground waters shall be determined or estimated. Upon completion of the sampling and analysis, the data shall be tabulated in the next R&D Status report, as specified in Item VI below.

B. In addition to items delineated in A above, conduct the following specific actions at sites identified on Bergstrom AFB IX:

1. Monitoring of Existing Wells

a. The contractor shall collect and analyze one ground-water sample from the existing well at the Golf Course. If the well cannot be sampled due to well development, well characteristics, or any other reason, the contractor shall indicate the reason(s) in the report specified in Item VI below.

b. The ground-water sample shall be analyzed for oil and grease-infrared method (O&G/IR), Total Organic Carbon (TOC), Total Organic Halogens (TOX), phenols, arsenic, barium, lead, chromium, cadmium, silver, mercury, selenium, and the organochlorine pesticides (including DDT isomers) specified in U.S. EPA method 608, and 2,4-D, 2,4,5-TP silver, and dibrom (as specified in Attachment 1).

c. The ground-water sample analyzed for organochlorine pesticides (including DDT isomers) specified in U.S. EPA method 608 shall be confirmed by the second gas chromatographic column which can be used to confirm measurements made with the primary column.

2. Site 17. South Fork Drainage Ditch

a. Collect 13 sediment samples from the site, one sample at the farthest upstream point of the ditch, one sample upstream of the oil/water separator, one sample downstream of the oil/water separator, one sample upstream of the landfill area, and nine samples in the landfill area.

b. Each sediment sample shall be analyzed for oil and grease-infrared method (O&G/IR), and lead, nickel, chromium, and copper.

3. Site 13. MOGAS Spill at Motor Pool

a. One soil boring shall be drilled at this site to a depth of 5 feet below the average water table surface. Samples shall be retained for analysis at 2 1/2-foot intervals from the surface to 20 feet BLS. From 20-45 feet BLS, samples shall be retained for analysis at five foot intervals and at the saturated/unsaturated zone interface. A maximum of six samples shall be analyzed.

b. Each soil sample shall be analyzed for O&G/IR, and lead, nickel, chromium, and cadmium.

c. Collect one ground-water sample from the site.

d. The ground-water sample shall be analyzed for purgeable hydrocarbons using U.S. EPA method 602, O&G/IR, Total Organic Carbon (TOC), and lead, nickel, chromium, and cadmium.

e. The groundwater sample analyzed for purgeable hydrocarbons using U.S. EPA method 602 shall be confirmed by the second gas chromatographic column which can be used to confirm measurements made with the primary column.

4. Site 23. Fire Training Area

a. Two soil borings shall be drilled at this site. Borings shall be advanced to 5 feet below the average water table surface. Samples shall be retained for analysis at 2 1/2-foot intervals from the surface to 20 feet BLS. From 20-45 feet BLS, samples shall be retained for analysis at five foot intervals and at the saturated/unsaturated zone interface. A maximum of 12 samples shall be analyzed.

b. Each soil sample shall be analyzed for O&G/IR, and lead, nickel, chromium, and cadmium.

c. Collect two ground-water samples from the site.

d. Each ground-water sample shall be analyzed for O&G/IR, TOC, lead, nickel, chromium, and cadmium, and volatile organic priority pollutants using U.S. EPA methods 601 and 602 (VOC).

e. Each ground-water sample analyzed for volatile organic priority pollutants using U.S. EPA methods 601 and 602 (VOC) shall be confirmed by the second gas chromatographic column which can be used to confirm measurements made with the primary column.

5. Sites 3,4,5,6,7 and 14. Combined Southeast Landfill

a. Install six ground-water monitoring wells, one well placed between each of the five landfills and the installation boundary, and one well placed northwest of the landfill area. Wells shall be an average of 50 feet in depth; total footage drilled shall not exceed 300 feet.

b. Collect two water samples from each well.

c. Each ground-water sample shall be analyzed for TOC, O&G/IR, total Organic Halogens (TOX), phenols, arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, the organochlorine pesticides (including DDT isomers) and PCBs specified in U.S. EPA method 608, and 2,4-D, 2,4,5-TP silvex and dibrom (as specified in Attachment 1).

d. Each ground-water sample analyzed for the organochlorine pesticides (including DDT isomers) and PCBs specified in U.S. EPA method 608 shall be confirmed by the second gas chromatographic column which can be used to confirm measurements made with the primary column.

e. Collect three soil samples from Site 14 along the road oiling area.

f. Each soil sample shall be analyzed for PCBs using U.S. EPA method 8080.

6. Site 8. JP-4 Spill/Overtopped Tank Area

a. One soil boring shall be drilled at this site to a depth of 5 feet below the average water table surface. Samples shall be retained for analysis at 2 1/2-foot intervals from the surface to 20 feet BLS. From 20-45 feet BLS, samples shall be retained for analysis at five foot intervals and at the saturated/unsaturated zone interface. A maximum of six samples shall be analyzed.

b. Each soil sample shall be analyzed for O&G/IR.

c. Collect one ground water sample from the site.

d. The water sample shall be analyzed for purgeable hydrocarbons using U.S. EPA method 602, O&G/IR, TOC, and lead, nickel, chromium, and cadmium.

e. The ground-water sample analyzed for purgeable hydrocarbons using U.S. EPA method 602 shall be confirmed by the second gas chromatographic column which can be used to confirm measurements made with the primary column.

7. Site 9. JP-4 Suspected Underground Line Leak.

a. Conduct a data review of the results of line pressure testing conducted on utility vaults and lines in the vicinity of Bldg 4544, Bergstrom flight tower, by base liquid fuels personnel on 3 April 1984. In addition, examine fueling and extraction procedures at the JP-4 low-flow point.

b. Conduct an acoustic emissions test of the pipeline. The pipeline shall be accessed by size 3' (W) x 7' (L) ditches excavated by means of a backhoe.

c. If it is determined through the data review and aconstic emissons testing that there is no evidence of any leaks in the JP-4 pipeline, all field efforts shall cease and no further work shall be accomplished. The contractor shall file the corresponding R&D Status Report and await further instruction from the USAF OEHL technical monitor.

d. Four soil borings shall be drilled at this site to a depth of 5 feet below the water table surface. Each boring shall be 30 feet in depth. Samples shall be retained for analysis at 2 1/2-foot intervals from the surface to 10 feet below the surface (BLS). From 10-30 feet BLS, samples shall be retained for analysis at five foot intervals and at the saturated/unsaturated zone interface. A maximum of 36 samples shall be analyzed.

e. Each soil sample shall be analyzed for purgeable hydrocarbons using U.S. EPA Method 602. Confirmatory (second column) analysis of soil samples shall be included.

f. Emplace a temporary well casing at each corehole.

g. Collect one ground-water sample from each corehole.

h. Each ground-water sample shall be analyzed for purgeable hydrocarbons using U.S. EPA Method 602. Confirmatory (second column) analysis of water samples shall be included.

i. Conduct a hydrocarbon survey at the four nearby utility manholes. Samples shall be obtained from undergrond utility vault or lines and collected with evacuated canisters.

j. Collect one air sample from each manhole.

k. Each air sample shall be analyzed for ambient hydrocarbons.

l. Install three ground-water monitoring wells, one well placed upgradient and two placed downgradient of the site. Wells shall be an average of 30 feet in depth; total footage drilled shall not exceed 100 feet.

m. Collect one water sample from each well.

n. Each ground-water sample shall be analyzed for purgeable hydrocarbons using U.S. EPA Method 602. Confirmatory (second column) analysis of the water samples shall be included.

C. Well Installation and Clean-up

The well and boring areas shall be cleaned following the completion of each well and boring. Drill cuttings shall be removed and the general area clean. If hazardous waste is generated in the process of well installation the contractor shall be responsible for proper containerization for eventual government disposal. Disposal of drill cuttings are not the responsibility of the contractor.

D. Results of all sampling and analysis shall be tabulated and incorporated in the Informal Technical Information report (Sequence 3 Atch 1 and Sequence 2 Atch 3 as specified in Item VI below) and forwarded to USAF OEHL/CVT for review.

E. Reporting

1. A draft report delineating all findings of this field investigation shall be prepared and forwarded to the USAF OEHL, as specified in Item VI below, for Air Force review and comment. This report shall include a discussion of the regional hydrogeology, well logs of all project wells, data from water level surveys, water quality analysis results, available geohydrologic cross sections, ground-water surface and gradient vector maps, any available vertical and horizontal flow vectors, and laboratory quality assurance information. The report shall follow the USAF OEHL format (mailed under separate cover).

2. Estimates shall be made of the magnitude and direction of movement of contaminants discovered. Potential environmental consequences of discovered contamination shall be identified or estimated. Where survey data are insufficient to properly determine or estimate the magnitude and direction of movement of discovered contaminants, fully justified specific recommendations shall be made for additional efforts required to properly evaluate contamination migration.

3. Specific requirements, if any, for additional soil borings or for future ground-water monitoring must be identified.

F. Cost Estimates

The contractor shall provide cost estimates for all additional work recommended to permit proper determination of contaminants. The recommendations provided shall include all efforts required to determine the magnitude and direction of movement of discovered contaminants along with an estimate of the time required to accomplish the proposed effort. This information shall be provided in a separately bound appendix to the draft final report.

II. Site Location and Dates:

Bergstrom AFB TX
Building, Time and
Dates to be established

III. Base Support: None

IV. Government Furnished Property: None

V. Government Points of Contact:

1. 1Lt Maria R. LaMagna
USAF OEHL/ECQ
Brooks AFB TX 78235
(512) 536-3667
AV 240-3367
2. 2Lt Victoria Reimer
USAF Hospital/SGPB
Bergstrom AFB TX 78743
(512) 479-2204
AV 685-2204
3. Col Jerry P. Dongherty
HQ TAC/SGPAE
Langley AFB VA 23665
(804) 764-5035
AV 432-2180

VI. In addition to sequence numbers 1, 5 and 11 which are applicable to all orders, the reference numbers below are applicable to this order. Also shown are data applicable to this order:

Sequence No.	Block 10	Block 11	Block 12	Block 13	Block 14
Atch 1					
4	ONE/R	84JUL27	<u>84NOV15</u>	<u>85MAR15</u>	*
3	ONE/T	**	**		2
Atch 3					
2	ONE/T	**	**		2

*A minimum of two draft reports will be required. After incorporating Air Force comments concerning the first draft report, the contractor shall supply the USAF OEHL with a second draft report. The report will be forwarded to the applicable regulatory agencies for their comments. The contractor shall supply the USAF OEHL with 20 copies of each draft report and 50 copies plus the original camera ready copy of the final report.

**Upon completion of analysis

VII. The ceiling price Items 0001 and 0002, as contemplated by the payments clause is \$88,242.04.

Attachment 1

Levels of Detection are for water unless shown otherwise:

Levels of Detection Required

VOC	*
** TOC	1 mg/L
** TOX	5 µg/L (waters); 5 µg/g (soil)
Oil & Gresse (IR)	0.1 mg/L (waters); 100 µg/g (soil)
Polychlorinated Biphenyls	0.25 µg/L (waters); 1 µg/g (soil)
Phenols	1 µg/L (waters); 1 µg/g (soil)
Arsenic	10 µg/L
Barium	200 µg/L
Cadmium	10 µg/L
Chromium	50 µg/L (waters); 5 µg/g (soil)
Copper	50 µg/L
Lead	20 µg/L (waters); 2 µg/g (soil)
Mercury	1 µg/L
Nickel	100 µg/L
Selenium	10 µg/L
Silver	10 µg/L

Pesticide Analyses (µg/L)

DDT isomer	0.02
Dibrom	0.03
2,4-D	0.06
2,4,5-TP silvex	0.06

For soils, use detection levels shown above, but report values as micrograms pesticide per gram of soil.

- * As specified in U.S. EPA Methods 601 and 602.
- ** Detection levels for TOC and TOX must be 3 times the noise level of the instrument. Laboratory distilled water must show no response. If so, corrections of positive results must be made.

RADIAN
CORPORATION

APPENDIX C

WELL-NUMBERING SYSTEM

APPENDIX C

Well-Numbering System

The well and borings drilled at Bergstrom ABF during the Phase II (Stage I) investigation are identified by an alpha-numeric label. Monitoring wells are labeled with the letters MW followed by a dash and then an Arabic numeral (e.g., MW-9). The core holes are labeled with the letter CH followed by a dash and then an Arabic numeral (e.g., CH-3).

Type of gravel/sand pack used Clemtex No. 2 (8-40 mesh)

Amount of gravel pack used 2 sacks

Grain size distribution of gravel pack Retained #8 (2.0%), #16 (51.2%), #20 (62.8%)¹

Lithology of gravel pack Mostly silica (94%)

Source (company and quarry/pit) Clemtex, Inc., Houston, Texas

Interval of gravel pack (ft-ft) 31.5-35.0 (10 ft. slough)

Interval of bentonite seal (ft-ft) 28.0-31.5

Interval of grouting (ft-ft) 1.5-28.0

Comments

Type of bentonite - Pellet
Type of grout - Portland Type 1 (neat cement)
#30 (78.4%), #40 (91.2%), #50 (98.9%), #100 (100.0%)

Description of Security Measures

Keyed meter box flush with the ground.

Padlock ID No. N/A Location of key(s) Bergstrom AFB

RADIAN
CORPORATION

Well Completion Log: Sheet 2 of 2 (Development)

Development started 2/22/85 Development ended 2/22/85
Static level of water before 30.38 (ft) and after 30.04 (ft) development.
Measuring point (MP) description Top of casing

MP Height 0.5 BGL (ft) Elevation 490.65 MSL (ft)
Quantity of water discharged during development 40 Bails = 11.4 gallons
Type, size/capacity of pump or bailer used for developmnt 0.284 gallon bailer

Depth of open hole inside well (below ground level on measuring point)
Before development N/A (ft) After development N/A (ft)

Date/Time	Discharge (GPM/Bail(s)) Note SWL start/End.(1)	Field Measurements			Remarks
		Temperature	Conductivity	pH	
2/25/85/ 1210	SWL 30.38 5 bails 10 bails 15 bails	23°C 23°C 23°C	720 780 790	*	pH meter was not operating correctly.
1225	20 bails	23°C	790		All samples were silty.

NOTE: (1) Depth measurements made by Steel Tape (ST); Rope and Bailor (R/B) and Electric Line (EL).
(2) Temperature in degrees celsius.
(3) Conductivity in micromhos/centimeter at field temperature.

APPENDIX E

RAW FIELD DATA

WELL DEVELOPMENT

Each of the six monitor wells were developed using a 1/3 h.p., single phase, 230 volt Franklin motor with a Goulds pump connected to a 1-1/4 inch flexible black poly-hose.

Each well was surged numerous times by lifting the pump intake to either the top of the screen or top of the water, if within the screen, and repeatedly turning the pump on and off. This was done at 3 points within the screen, then the pump was raised and lowered the length of the screen before being placed on bottom to remove any resulting silt. This surging process was repeated until the water condition was clear and approved by the on-site Radian representative.

WELL DEVELOPMENT - MONITOR WELL NO. 1

Screen: 21.4' to 31.4' bgf

Top of Sand: 18.6' bgf

March 28, 1984

WL TOC 0910 hours 22.87'

WL TOC with pump in well 19.99'

<u>Time</u>	<u>Pump</u>	<u>Result</u>
0925 hrs.	pump on	water very silty
0930 hrs.	10 gpm	water very silty
1000 hrs.	10 gpm	water moderately silty
1025 hrs.	8 gpm	water clear, rate cut back to stabilize WL
1030 hrs.	8 gpm	began surging well screen, surged 4 times, becomes very silty
1100 hrs.	8 gpm	water clear
1115 hrs.	8 gpm	surged screen 2 times, moderate increase in silt
1130 hrs.	8 gpm	water clear, surged well 3 times, water remains clear
1140 hrs.	8 gpm	shut-off pump

Total volume pumped 1,160 gallons

Maximum drawdown 22.96' TOC

WELL DEVELOPMENT - MONITOR WELL NO. 2

Screen: 19.6' to 30.0' bgl

Top of Sand: 16.8' bgl

March 29, 1984

WL TOC 0950 hours 20.08'

WL TOC with pump in well 19.23'

<u>Time</u>	<u>Pump</u>	<u>Result</u>
1000 hrs.	pump on	water very silty
1015 hrs.	6 gpm	water moderately silty
1030 hrs.	6 gpm	water clear, surged screen 2 times water becomes very silty
1146 hrs.	7.5 gpm	water clear, surge 5 times, water becomes moderately silty
1210 hrs.	7.5 gpm	water clear, surge 4 times, water remains clear
1225 hrs.	9 gpm	water clear, rate change without valve adjustment
1250 hrs.	9 gpm	water clear, surged well 2 times, no silt developed
1256 hrs.	9 gpm	shut-off pump

Total volume pumped 1,327 gallons

Maximum drawdown 23.92' TOC

WELL DEVELOPMENT - MONITOR WELL NO. 3

Screen: 16.0' to 26.0' bgl

Top of Sand: 14.0' bgl

March 28, 1984

WL TOC 1210 hours 19.75'

WL TOC with pump in hole 13.84'

<u>Time</u>	<u>Pump</u>	<u>Results</u>
1220 hrs.	began pumping	water very silty
1225 hrs.	1 gpm	water very silty
1455 hrs.	1 gpm	water clear
1500 hrs.	1 gpm	surged screen 5 times, water becomes moderately silty
1530 hrs.	2 gpm	increased rate
1536 hrs.	4 gpm	increased rate
1800 hrs.	4 gpm	surged well 5 times, water remains clear
1924 hrs.	4 gpm	shut-off pump

Total volume pumped 1,139 gallons

Maximum drawdown 20.15' TOC

WELL DEVELOPMENT - MONITOR WELL NO. 4

Screen: 19.6' to 29.6' bgl

Top of Sand: 15.6' bgl

April 3, 1984

WL TOC 21.33'

WL TOC with pump in well 19.67'

<u>Time</u>	<u>Pump</u>	<u>Result</u>
0940 hrs.	pump on	very silty
0950 hrs.	0.5 gpm	very silty
1000 hrs.	pumped off	
1020 hrs.	10 gpm for 20 sec.	very silty
1040 hrs.	10 gpm for 20 sec.	very silty
1110 hrs.	10 gpm for 20 sec.	very silty
1130 hrs.	10 gpm for 20 sec.	moderately silty
1150 hrs.	10 gpm for 20 sec.	moderately silty
1320 hrs.	10 gpm for 30 sec.	moderately silty
1350 hrs.	10 gpm for 20 sec.	slightly silty
1400 hrs.	10 gpm for 20 sec.	nearly clear
1410 hrs.	10 gpm for 20 sec.	nearly clear

Total volume pumped 39 gallons

Maximum drawdown dry

WELL DEVELOPMENT - MONITOR WELL NO. 5

Screen: 29.9' to 40.0' bgl

Top of Sand: 23.8' bgl

March 29, 1984

WL TOC 27.37'

Bailed 62 liters (16.4 gallons)

Water was very silty in beginning, but cleared up with last 8 bails

April 2, 1984

WL TOC 27.31'

WL TOC with pump in well 25.56'

<u>Time</u>	<u>Pump</u>	<u>Results</u>
1500 hrs.	pump on	moderately silty
1510 hrs.	0.5 gpm	moderately silty
1600 hrs.	0.5 gpm	pumped off
1610 hrs.	10 gpm for 30 sec.	moderately silty
1620 hrs.	10 gpm for 25 sec.	moderately silty
1625 hrs.	10 gpm for 20 sec.	moderately silty
1710 hrs.	10 gpm for 30 sec.	moderately silty
1720 hrs.	10 gpm for 20 sec.	slightly silty
1730 hrs.	10 gpm for 20 sec.	slightly silty
1750 hrs.	10 gpm for 20 sec.	very slightly silty
1845 hrs.	10 gpm for 30 sec.	very slightly silty

Total volume pumped 61.2 gallons

Maximum drawdown dry

April 3, 1984

Unknown volume bailed by Radian Personnel

WELL DEVELOPMENT - MONITOR WELL NO. 6

Screen: 15.0' to 25.0' bgl

Top of Sand: 14.0' bgl

April 2, 1984

WL TOC 21.82

WL TOC with pump in well 19.99'

<u>Time</u>	<u>Pump</u>	<u>Result</u>
0900 hrs.	pump on	water very silty
0905 hrs.	3.5 gpm	water very silty
0915 hrs.	3.5 gpm	water slightly silty
0937 hrs.	3.5 gpm	water very slight silty
0950 hrs.	3.5 gpm	surge screen 3 times, water becomes very silty
1145 hrs.	3.5 gpm	water very slightly silty, surge 4 times, water becomes very silty
1400 hrs.	3.5 gpm	clear, surge 4 times, no silt
1430 hrs.	3.5 gpm	water clear, pump shut-off

Total volume pumped 1,155 gallons

Maximum drawdown 22.20' TOC

APPENDIX F

SAMPLING AND ANALYTICAL PROCEDURES

BERGSTROM AFB IRP PHASE II STAGE 1
FIELD INVESTIGATION SAMPLING
QUALITY CONTROL PLAN

Prepared by:

**Radian Corporation
8501 Mo-Pac Blvd.
Austin, Texas 78766**

1.0

INTRODUCTION

Field investigations under the US Air Force Installation Restoration Program generate a large number of soil, waste and/or water samples for chemical analysis. The analytical results are then used to interpret the impact of a waste site upon the local hydrogeologic system(s). Since each analysis forms a foundation for interpretation, it is important that each sample is representative of a particular situation.

A quality control (QC) plan provides a guideline through which field samples can be obtained, preserved and controlled. This will ensure that the integrity of the sample is maintained and that no contamination or cross contamination will occur.

The remainder of this QC plan describes the general collection of soil, waste and water samples. Methods of preservation, shipping and administrative controls are also discussed.

2.0

QUALITY CONTROL PROCEDURES FOR SOIL AND WASTE SAMPLING
AND ANALYSIS

Based upon the sampling scheme as discussed in the Statement of Work, soil and possibly waste samples will be collected from the following areas:

- o South Fork Drainage Ditch
- o MOGAS Spill at Motor Pool
- o Fire Training Area
- o Combined Southeast Landfill
- o JP-4 Spill/Overtopped Tank Area
- o JP-4 Suspected Underground Line Leak

Analytical parameters for the soil samples are summarized in Table 2-1. Field collection procedures are described in Table 2-2. Quality control procedures for sample collection and analysis are discussed below.

2.1

Collection of Soil Samples

Quality control procedures associated with soil sampling will be an integral part of the sampling methodology. These procedures focus upon ensuring the collection of representative samples which are free from external contamination. Documentation and chain-of-custody procedures are also an important part of the sample collection QC effort, which include the following procedures:

- o Split-spoon and hand auger sampling will be used to obtain representative samples from depth specific points, as opposed to sample cuttings which may originate at different points and be cross-contaminated.

TABLE 2-1.

Levels of Detection are for water unless shown otherwise:

Levels of Detection Required

VOC	*
** TOC	1 mg/L
** TOX	5 ug/L (waters); 5 ug/g (soil)
Oil & Grease (IR)	0.1 mg/L (waters); 100 ug/g (soil)
Polychlorinated Biphenyls	0.25 ug/L (waters); 1 ug/g (soil)
Phenols	1 ug/L (waters); 1 ug/g (soil)
Arsenic	10 ug/L
Barium	200 ug/L
Cadmium	10 ug/L
Chromium	50 ug/L (waters); 5 ug/g (soil)
Copper	50 ug/L
Lead	20 ug/L (waters); 2 ug/g (soil)
Mercury	1 ug/L
Nickel	100 ug/L
Selenium	10 ug/L
Silver	10 ug/L

Pesticide Analyses (ug/L)

DDT isomer	0.02
Dibrom	0.03
2,4-D	0.06
2,4,5-TP silvex	0.06

For soils, use detection levels shown above, but report values as micrograms pesticide per gram of soil.

* As specified in U. S. EPA Methods 601 and 602.

** Detection levels for TOC and TOX must be 3 times the noise level of the instrument. Laboratory distilled water must show no response. If so, corrections of positive results must be made.

TABLE 2-2. FIELD COLLECTION OF SAMPLES

Following guidance is provided field survey personnel to assist them in collecting, preparing and preserving samples.

Soil Sample Collection

Soil samples will be placed in containers as described below:

Analysis Required

Oil and Grease, Lead, Nickel,
Chromium, Cadmium and Copper

Field Procedure

Prepare a homogeneous soil mixture and fill a 1-quart glass jar with Teflon liner. Note: One jar provides RAS with sufficient soil to perform any or all requested analyses. Keep samples chilled to 4°C.

Water Sample Collection

Analysis Required

TOC and/or phenol

Field Procedure

Collect sufficient water and fill a 500 ml glass jar. Add 2 ml (1 plastic pipet full) of Sulfuric Acid. Keep samples chilled to 4°C.

Purgeable Halocarbons and Aromatics

Collect sufficient water and fill 2 each 40 ml VOA vials to the top (no air bubbles present). Cap and seal the vials. No air bubbles should be present. Keep samples chilled to 4°C.

TOX

Collect sufficient water and fill a 500 ml glass bottle to top (no air present). Keep samples chilled to 4°C.

Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Selenium and Silver

Collect sufficient water and fill a 500 ml plastic bottle. Add 2 ml (1 plastic pipet full) of Nitric Acid. Keep samples chilled.

Oil and Grease

Collect sufficient water and fill a 1-quart glass bottle nearly to the top. Add 2 ml (1 plastic pipet full) of Sulfuric Acid. Keep samples chilled.

Pesticides/Polychlorinated Biphenyls

Collect sufficient water and fill a 1-liter glass bottle to the top. Cap with Teflon liner. Keep sample chilled to 4°C.

Air Sample Collection

Analysis Required

Purgeable Hydrocarbons

Field Procedure

Fill a stainless steel evacuated cylinder with ambient air from selected site.

- o During the drilling, the on site geologist will ensure that cuttings coming to the surface on the auger flights are accurately described. This will serve as a general log to be confirmed by split-spoon samples.
- o The split-spoon or hand auger sampler will be cleaned between each sampling to prevent cross-contamination of the samples in accordance with the safety plan.
- o After sample collection, each sample will be logged into a master sample logbook (bound, paginated, laboratory notebook) which as a minimum indicates the date and time of sample collection, sample type, and initials of the person who collected the sample.
- o Soil samples will be chilled for preservation until analyses.
- o Chain-of-custody forms, Figure 2-1 will be used to document all Radian and USAF transfers of sample possession from initial preparation of the sample container to final disposition of the sample.

2.2 Analytical Quality Control for Soil Samples

In addition to the general sampling QC procedures described above, specific QC procedures and criteria are associated with various analyses and described below:

2.2.1 Metals

Heavy metals will be determined after acid extraction in accordance with EPA methods. Determination for these metals will involve both

inductively coupled plasma emission spectrometry (ICPES) and atomic absorption spectroscopy (AAS). The metals to be analyzed are presented in Table 2-1. Calibration and QC procedures for metals analyses are discussed below. These procedures are based upon EPA recommended procedures for the 200 Series Methods.

2.2.2 Calibration

Calibration curves will be generated daily for each metal species using a reagent blank and a minimum of three upscale concentrations. A calibration curve will be considered acceptable if the correlation coefficient, r , is ≥ 0.995 . A new calibration curve will be generated after analysis of no more than 20 samples. The new curve will be acceptable if it meets the linearity criterion above, and if the slope agrees with that of the previous curve within $\pm 10\%$.

3.0 QUALITY CONTROL PROCEDURES FOR GROUNDWATER SAMPLING AND ANALYSIS

Based upon the sampling scheme as discussed in the Statement of Work, ground-water samples will be collected from the following areas:

- o Existing Wells
- o MOGAS Spill at Motor Pool
- o Fire Training Area
- o Combined Southeast Landfill
- o JP-4 Spill/Overtopped Tank Area
- o JP-4 Suspected Underground Line Leak

Analytical parameters for the ground-water samples are summarized in Table 2-1. Field collection procedures are described in Table 2-2. Quality control procedures for sample collection and analysis are discussed below.

3.1 Sampling Quality Control for Groundwater Samples

Quality control efforts associated with groundwater sampling are primarily procedural quality control activities which are an integral part of the monitoring well development and sampling methodology. These procedures focus upon ensuring that the samples are representative of the specified depth and as free as possible from external and/or cross-contamination. Examples of the QC aspects of the groundwater sampling effort include the following:

- o Groundwater levels will be measured and recorded before any groundwater disturbances.
- o Initially, all wells will be pumped or bail-developed in order to remove all fines within the well and, to the extent possible, remove any drilling fluid, if used, which may have penetrated the formation during the drilling.

- o All wells that are sampled will be evacuated with a clean PVC bailer or bladder pump until the pH and specific conductance of the groundwater stabilizes or until three well volumes of water have been displaced. In some cases the well may be bailed dry due to slow infiltration.
- o Following evacuation, wells will be allowed to recover prior to sampling.
- o Depth-discrete samples will be obtained utilizing a Kemmerer-type sampler constructed of inert materials to minimize the potential for sample contamination. If well conditions do not permit the use of a Kemmerer sampler then a Teflon bailer will be used.
- o Samples must be transferred to sample jars with a minimum of agitation and disturbance in order to prevent stripping volatile organics from the water sample.
- o All sampling equipment will be thoroughly cleaned prior to the start of work and between wells.
- o Upgradient wells will be sampled first in order to minimize possible transfer of any contaminants among the wells.
- o All samples will be chilled during transportation and storage.

3.2 Chain of Custody

Chain of custody documentation must accompany all samples. The chain of custody records will contain, at a minimum, the following information:

- o Time, date, and location of sampling, and name of person performing sampling;
- o Number, depth, and type of sample;
- o Conditions encountered during well evacuation and water sample collection;
- o The signature of the responsible on-site hydrogeologist, and the time and date he relinquished the samples to either the field laboratory technician or the transporter who will deliver samples to the analytical laboratory.

3.3 Analytical Quality Control for Groundwater Samples

In addition to the general QC procedures described above, specific QC procedures and criteria are associated with groundwater analyses. These are described below.

3.4 Purgeable Aromatics

Purgeable aromatics in the groundwater samples will be determined by a purged-cryotrap GC/PID method similar in some respects to EPA Method 602. Quality control procedures for this method are based on recommended procedures for Method 602 analyses.

3.5 Acceptability Tests

Section 8.2 of Method 602 describes the procedures for demonstrating ability to generate data of acceptable precision and accuracy. Briefly, this involves quadruplicate analyses of reagent water spiked with a "quality control check sample concentrate" and a "surrogate standard." Average percent recoveries and standard deviations are then calculated for each compound and compared to EPA values (Table 2, Method 602) to determine acceptability. These data should be available for inspection, but the acceptability test need not be repeated specifically for this project.

4.0 QUALITY CONTROL PROCEDURES FOR AIR SAMPLING AND ANALYSIS

Based upon the sampling scheme as discussed in the Statement of Work, air samples will be collected from:

- o JP-4 Suspected Underground Line Leak.

Analytical methods for air samples are described below. Field collection procedures are described below and in Table 2-2.

4.1 Canister Sampling

Ambient air samples are collected in evacuated stainless steel canisters. The canisters are 2.8 liter stainless steel spheres fabricated with stainless steel valves and fittings. The canisters are oven-baked, purged, and evacuated in the laboratory prior to sampling, and the absolute pressure is recorded. The canister vacuum provides the motive for vapor collection, avoiding the possible adverse effect of a pump on the sampling system. The sample is collected by connecting the canister to a sampling line and opening the valve. A sample of approximately 2 L (a canister volume = 2.8 liters) is collected, and the canister valve is closed.

After completion of the sampling, all canister valves are tightened and stem nuts sealed with Swagelock plugs and the canister is shipped to Austin.

4.2 Canister Analysis

When received by Radian personnel at Radian's Austin laboratory, each stainless steel canister will be assigned a code number and logged into a computerized master log. The final pressure will be read and recorded on the sample chain of custody form before pressurizing the canister with ultra high purity nitrogen (UHP N₂) to 10-15 psig. The final pressure is then measured

and recorded. Nitrogen is added to the canisters to provide positive pressure for removing the sample.

To achieve the desired detection levels, volatile organic species are separated from the ambient air matrix and concentrated. This is accomplished by passing the canister air sample through a Perma-Pure drying tube to remove water vapor and then through a trap cooled in liquid argon. The amount of sample passed through each trap varies depending on the levels of hydrocarbons which are present. Normally, a volume of 500 mL is used. The volume of sample passed through the traps is collected in a fixed volume reservoir, and the pressure drop is measured and recorded with a high precision pressure gauge. When the desired volume of sample has been passed through the traps, hydrocarbon species are desorbed directly onto the analytical columns by heating the traps to 100 C while backflushing with carrier gas.

All analyses are performed on a Varian 3700 GC. Volatile organic species are separated onto two 60 m SE-30 fused silica capillary columns. The VOC's from the column are eluted into a flame ionization detector (FID) which detects and quantitates hydrocarbon species. The chromatograph output is monitored for 40 minutes, or until no peaks are observed. The VOC's from one column are passed through a fused silica splitter which is connected to both a flame ionization detector (FID) and a photoionization detector (PID). The FID is used to detect and quantitate hydrocarbon species. The PID is used to generate toluene normalized response (TNR) factors for the components of interest, providing additional qualitative information.

The VOCs from the second column are analyzed by a Hall Electrolytic Conductivity Detector (HECD) operated in the halogen mode. This provides specific detection of halogenated VOCs which may not have otherwise exhibited adequate response characteristics on the FID/PID.

The output from the gas chromatograph will be processed with a Varian 401 Chromatographic Data System (CDS). This CDS provides peak areas and

retention times. A second data system, Apple II Plus microcomputer, will be used to identify peaks on the basis of retention times and to compute quantitative results by comparing peak areas with a previously established standard response.

When a VOC is identified on both the HECD and FID/PID, the HECD Concentration value will be reported. When a halogenated VOC is identified by FID/PID, but not confirmed by HECD, it will be reported as an unidentified VOC.

The list of hydrocarbon species on file in the data system is given in Table 1. Detection limit information is also provided in Table 1. Species that cannot be identified are quantitated and listed as "unidentified".

4.3 Chain of Custody

Chain of custody documentation must accompany all samples. The chain of custody records will contain the following information:

- o Time, date, and location of sampling, and name of person performing sampling.
- o Number and type of sample.

RADIAN

THE QUALITY ASSURANCE/QUALITY CONTROL PROGRAM FOR RADIAN ANALYTICAL SERVICES

Radian Analytical Services' (RAS) objective is to provide high quality chemical analyses to all clients regardless of the size of the analytical task. To aid in achieving this goal, a strong quality assurance program and rigid quality control practices are integral parts of all analyses. This document describes these quality assurance/quality control protocols for the Radian Analytical Services laboratories.

The basic quality control program includes procedures for sample handling, calibration, spiking and replicate analyses, analysis of QC test samples, equipment maintenance, and supplies control. These procedures can be integrated with a client's additional requirements, such as spiking studies, analysis of replicate samples, linearity determinations, and stability studies.

The quality assurance program consists of the frequent submission of blind QA samples, duplicates, and spiked sample splits. Also included are personnel training, analytical methodologies, sample control procedures, data handling, and equipment maintenance and calibrations.

1.0 QA Organization/Policy

The objective of Radian's quality assurance/quality control program is to assure, assess, and document the precision, accuracy, and adequacy of data obtained from chemical analysis and to assure the technical accuracy of the results obtained for all samples.

Radian has organized the quality assurance function within the company to allow complete independence of program review. Radian's Quality Assurance Director reports directly to the Vice President of the Technical Staff. This position provides independent reviews at all levels of the technical staff and laboratory organization and allows immediate access to Radian's top management on QA-related matters.

The QA Director's involvement may be limited to a review of quality control practices or as extensive as active development and implementation of quality control procedures and statistical data analysis. The QA Director may be asked to contribute expertise and assistance when a need is perceived by either the client, the technical staff, or the management staff.

Because of the large number of samples analyzed by RAS, a QA coordinator has been assigned to monitor and maintain an effective QA/QC program for these laboratories. The RAS Quality Assurance Coordinator, directly responsible to the Corporate QA Director, serves as an independent auditor of all RAS laboratories. The responsibilities of the RAS QA Coordinator are as follows:

- Monitor QA/QC within RAS laboratories,
- Supervise the preparation of blind audit samples,

RADIAN

- inform the Director of RAS and the corporate QA Director of quality assurance problems,
- summarize and report QA activities in the laboratories,
- document all QA and QC procedures within RAS,
- act as liaison between the corporate QA Director and RAS,
- provide QA data to the corporate QA Director for inclusion in the corporate QA reports.

The RAS laboratory managers function as the quality control coordinators in each particular analytical area. Their efforts are coordinated and monitored by the QA Coordinator.

Quality control coordinators serve as a focal point for all QC activities pertaining to each RAS laboratory. They work as a committee coordinated by the RAS Quality Assurance Coordinator. Their activities include the following:

- monitor the QA/QC activities of the laboratory area,
- inform the Director of Analytical Services and the QA coordinator of QC problems and needs.
- summarize, document, and report quality control activities and data generated in the laboratory,

- provide documentation of all QC procedures in the laboratory,
- maintains summaries of QC activities and data in a form suitable for client review upon request.

2.0 Quality Control for Laboratory Analyses

Radian Analytical Services has developed and implemented quality control procedures for all of the analyses performed in the laboratory. The laboratory quality control program provides an effective and efficient laboratory protocol for QC regardless of the size or scope of the analytical requirements. Approved analytical methods are used whenever available. When approved methods are not available, a method is developed by the Radian technical staff, and a technical note written describing the method. The quality control procedures are designed to insure that the standard operating procedures and quality control protocols are being followed and accurate results are obtained.

The general quality control program utilized in each laboratory includes consideration of the following areas:

- personnel training and certification,
- analytical methodology documentation,
- sample handling and control,
- laboratory facilities and equipment,
- calibration and standards,
- data handling and documentation,
- quality control check samples,

The general approach to quality control in each of these areas is discussed in the remainder of this section.

RADIAN

2.1 Personnel Training and Certification

The successful implementation of any QA/QC program is determined by the training and dedication of the laboratory personnel. The quality and consistency of data should be independent of the analyst. With the proper training and supervision, an analyst will be able to obtain quality data by the use of proven methodology. Periodic assessment of training requirements and certification are performed to maintain a high level of laboratory awareness.

The training and certification methods employed in the RAS laboratories are briefly described below:

- study of laboratory standard operating procedures,
- study of QA manual,
- observation of experienced operators/analysts,
- study of operating manuals,
- instruction by the laboratory manager on all aspects of the analysis,
- perform the analysis under the direct supervision of the laboratory manager,
- perform analysis under supervision of experienced personnel,
- analysis of blind QC samples prepared by laboratory QC coordinator,
- participation in in-house seminars on laboratory methods and procedures.

PERSONNEL TRAINING RECORD

Employee Number _____

Date of Employment _____

Laboratory Orientation:

Upon completion of each phase of personnel training the employee and Laboratory Manager will initial and date the step completed.

- The RAS laboratory Standard Operating Procedures have been read and understood.

Employee Lab Mgr. Date

- The RAS Quality Assurance manual has been read and the procedures for the laboratory in which the employee worker have been explained.

Employee Lab Mgr. Date

- Operation manuals for instruments with which the employee performs analyses have been studied and the procedures for operation and maintenance are understood.

<u>Instrument</u>	<u>Employee</u>	<u>Lab Mgr.</u>	<u>Date</u>	<u>Instrument</u>	<u>Employee</u>	<u>Lab Mgr.</u>	<u>Date</u>

Figure 2-1.

Test Specific Training:

Each specific test performed in the RAS laboratories involves procedures which may be unique. The steps involved in training an employee are:

- Instruction by the Laboratory Manager on all aspects of the analysis,
 - Observation of experienced operators/analysts,
 - Perform the analysis under supervision of the laboratory manager,
 - Perform analysis of OA samples submitted by the QA coordinator, and
 - Participation in in-house seminars on laboratory methods and procedures.

The following table is to be completed by dating and initialing by the employee and Laboratory Manager upon completion of each step.

Figure 2-1. (Cont'd)

RADIAN

All RAS personnel must complete a quality control training program. This system includes motivation toward producing data of acceptable quality and involves "practice work" by new employees. New personnel are made aware of the quality standards established by RAS and the reasons for those standards. They are made aware of the various ways of achieving and maintaining quality data. After an employee has been trained to use a method and the work validated by the laboratory manager, the employee is certified to perform the analysis. As these people progress to higher degrees of proficiency, their accomplishments are reviewed and then documented. Documentation of proficiency training is maintained by the QC Coordinator for each laboratory technician using the two-page form shown in Figure 2-1.

2.2 Analytical Methodologies

All analytical procedures followed in the RAS laboratories are documented in a methods manual for the specific laboratory. A set of standard operating procedures (SOP) has been established for each analysis to insure consistency. Most methods used are directly from an approved analytical manual, e.g., EPA methods, APHA Standard Methods for Water and Wastewater, ASTM, etc.

Methodologies may contain the following information:

- method title,
- scope of method,
- summary of interferences, and applications,
- concentration ranges and detection limits,
- safety precautions,
- required equipment and materials,
- standardization directions,
- detailed analytical procedure,
- calculations, with examples,
- reporting method,
- precision and accuracy statement,
- references.

RADIAN

2.3 Sample Control and Record Keeping

The Radian Analytical Services Sample Control Center is a controlled access area. Only employees of the Sample Control Center have access to sample receiving, sample storage, documentation files, and the computer terminals. Analysts check out samples under the supervision of the sample control personnel. All samples are stored in locked storage areas. Sample tracking is maintained by a computerized laboratory management system and a sample checkout logbook. The RAS Sacramento laboratory is linked to the central processing unit of the computer in Austin via a dedicated phone line. This insures that the laboratories are in constant communication. All sample information and data entries can be immediately accessed at either location.

Detailed record keeping and control of samples are essential for effective laboratory operation. All samples received for analysis in the Radian Analytical Service laboratories are processed through the Sample and Analysis Management System (SAM). Radian Corporation's SAM is a software and hardware system for controlling and handling information for the analytical laboratory. SAM provides a dynamic, easy-to-use method for tracking, scheduling, reporting, and laboratory management. The system has been designed to accommodate and promote good laboratory management practices by providing high visibility of the information laboratory managers need to make good decisions regarding schedules and priority. The system is designed around a Data General Nova-IV computer with a 64K-byte memory. It also includes a 65M-byte disk drive and a line printer with plotting capabilities. Data is entered via a TEC terminal and CRT. All data stored on the disk is backed up on magnetic tape to prevent loss in the event of a system malfunction. The system is designed so that an individual designated as the principal operator can process the required paperwork for a large laboratory with little difficulty. The approach centralizes information input and data retrieval, and provides the mechanism for organized, up-to-date laboratory performance monitoring.

RADIAN

SAM maintains complete client information files, generates laboratory status reports, flags sample analyses which are overdue, accepts analysis results manually or automatically, and generates reports and invoices.

The Sample Control Center and SAM have six basic functions:

- sample receipt and logging,
- sample storage and maintenance of sample integrity,
- laboratory status reporting,
- document control,
- data compilation and reporting, and
- invoicing

In order to assure the integrity of a sample and the accompanying documentation, a security plan has been established. This plan consists of three parts:

- chain of custody,
- secured refrigerated storage, and
- document control.

The progression of samples and documentation through the Sample Control Center and the analytical laboratories is presented in Figure 2-2. Detailed descriptions of each sample control function are presented below:

- Samples are received from the commercial carrier at Radian's shipping and receiving facilities by the receiving clerk.
- Within one hour of arrival, the samples are accepted by RAS sample control personnel.

RADIAN

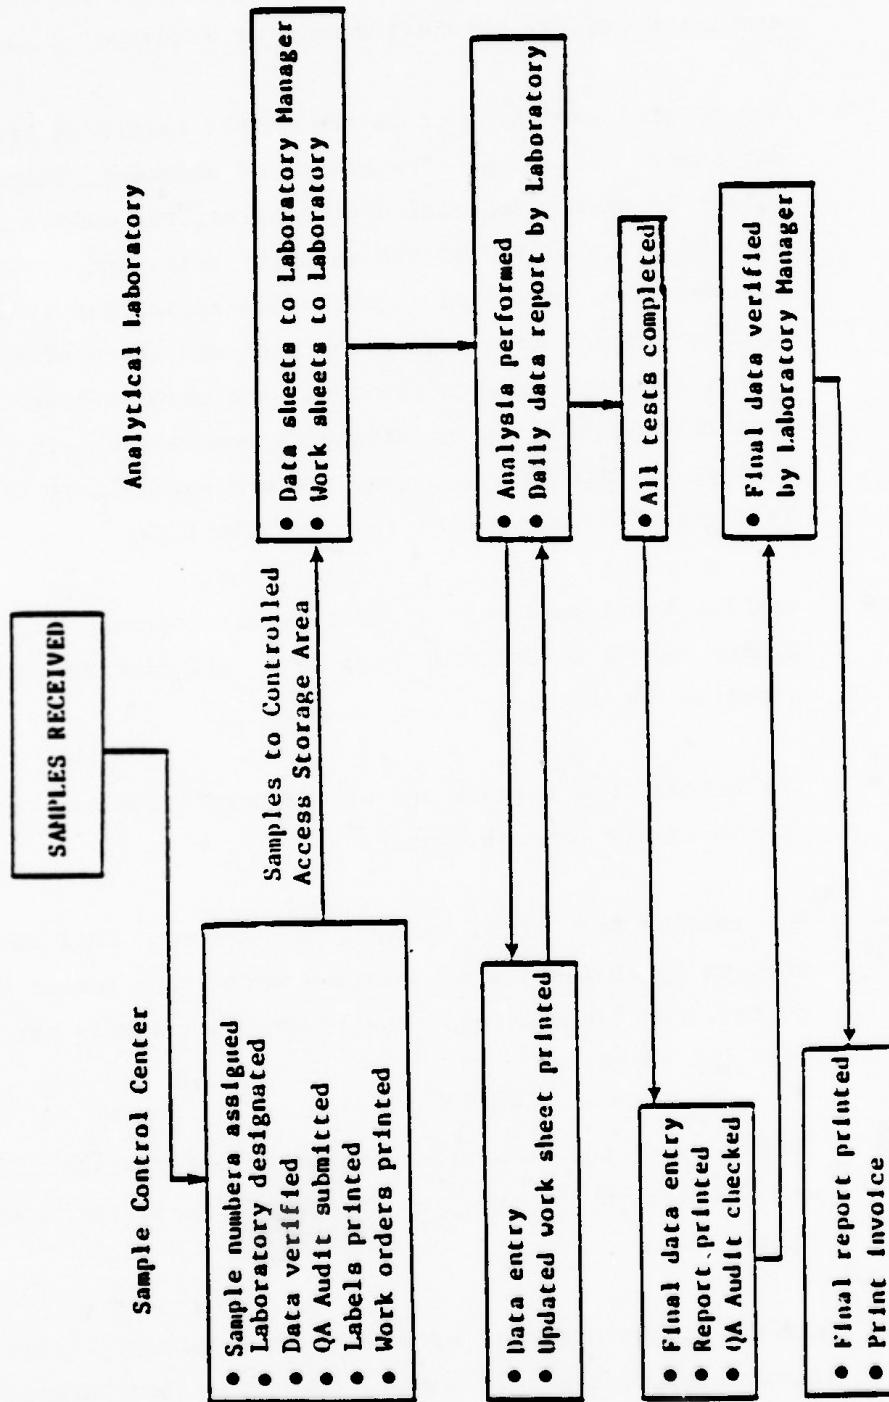

Figure 2-2. SAM Laboratory Management System

- All shipping containers and security seals, when appropriate, are inspected for physical damage or evidence of tampering.
- The samples are unpacked in the sample receiving area by the RAS sample custodian. The method of shipment, shipping container integrity, condition of samples, the number of samples/container, integrity of the security seal, and accompanying documentation are noted. Sample identification is verified against custody documents. The enclosed chain-of-custody forms, Figure 2-3, when required, are completed and filed with the shipping and receiving documentation. In the event that peculiarities are noted, the project officer or client is immediately advised of the irregularity.
- Samples are logged into a bound sample logbook, Figure 2-4. Again, sample identity is verified. All discrepancies are noted in the logbook.
- The handwritten logbook and all documentation are transferred to the Sample Control Center.
- The samples are logged into the SAM system. Each batch of samples is assigned a consecutive work order number by the system. Analytical requirements for each sample are entered into the computer.
- Hard copy of the work order and other information is printed and filed with the received documentation in the Sample Control Center.
- Labels are printed and secured to each sample. Label information includes sample number, identification, storage location, and analytical requirements.

Figure 2-4. Sample Log Sheet

- Data sheets and work sheets are printed for each batch of samples and distributed to the appropriate laboratory managers. The work sheets list sample numbers, sample identification, storage location, and analytical requirements. Data sheets are for results and contain only the parameters to be determined by a given laboratory.
- Following sample logging, the samples are placed in the designated locked storage area.
- Subsequent sample custody is documented and all transactions witnessed by sample control personnel.
- The analyst retrieves the samples from the Sample Control Center by sample number and storage location.
- The Sample checkout log (Figure 2-5) is completed by the analyst, noting the laboratory to which the sample is being removed.
- After analysis, or when the required aliquot is removed, the sample is returned to the Sample Control Center and return is noted in the sample checkout log.
- The sample is returned to the designated storage location.
- When requested, addition chain-of-custody documentation can be provided using a SAM-generated document (Figure 2-6). This document can be retained by sample control to provide a more easily retrievable record of sample custody within the analytical laboratory.
- The sample is stored until the assigned time or written permission is given to either properly dispose of or return the sample to the client.

RADIAN

- All documentation, including shipping documents, field sampling documents, computer-generated log sheets, chain-of-custody forms, laboratory data sheets, final computer reports, and other documents, are maintained in the sample control area. All reports are kept in locked filing cabinets. As with the sample storage area, the document storage area is limited-access.

All storage areas are within the Sample Control Center and are locked when not in use. Access to the storage area is limited to sample control personnel or other RAS employees accompanied by sample control personnel. There are four storage locations that are used depending on the sample and the required analyses. They are:

- ambient storage for samples that do not require refrigeration,
- 4°C storage for most samples requiring water quality analysis and extractable organics,
- 4°C storage for samples requiring volatile organic analysis, and
- -20°C storage for extracts and samples that require freezing.

A temperature log is maintained to monitor the cold storage facilities.

2.4 Laboratory Facilities and Equipment

A clean well-lighted, and well maintained laboratory is essential for accurate analytical results. Each laboratory is well-lighted, air conditioned and equipped with chemical fume hoods. Instrumentation that may emit noxious odors is vented externally.

Quality Control of Equipment and Supplies

Each laboratory QC program includes detailed requirements for equipment and supplies. Reagents, solvents, and standards with specific levels of purity are used as specified by the analytical protocol. Specific GC column materials, glassware and sample handling equipment are also specified. The quality control procedures for equipment and supplies generally include the following items:

- operator checklists for required supplies,
- documentation and reporting of all deviations from specified instrument performance,
- procedures for testing for purity of reagents,
- tolerances for calibrated glassware where applicable,
- monitoring of refrigerated storage space,
- maintenance logbooks,
- service contracts on analytical instrumentation.

Quality control procedures during sample preparation include the preparation of reagent or solvent blanks. Additional quality control techniques implemented in sample preparation include:

- deionized water piped into all laboratories, monitored daily,
- purchasing high purity distilled-in-glass solvents in large quantities from a single lot,

RADIAN

- use of Ultrex acids in trace metal digestion,
- cleaning of organic glassware with chromic acid or firing in a kiln at 450°C,
- cleaning of trace metal glassware with nitric acid,
- use of organic-free water prepared at Radian by distillation over alkaline permanganate under nitrogen atmosphere in all-glass still,
- use of volatile-free water prepared by purging organic-free water with nitrogen,
- sample preparation performed by experienced technical personnel under the supervision of senior level analysts.

2.5 Quality Control for Standards and Calibration

The quality of all test results is greatly impacted by the calibration procedures used. Calibration procedures and standards should be specified for all equipment and supplies used in the test procedure. Traceability to common standards is essential for test procedures to be used in multiple laboratories. Quality control procedures for standards and calibrations include the following considerations:

- written, detailed calibration instructions,
- preparation procedures for secondary standards, when applicable,
- requirements for frequency of calibration,
- recordkeeping of all calibrations and standards used,

RADIAN

- quality control charts for recording results from multiple calibrations,
- evaluation of internal standards, and
- tolerances for calibration requirements.

All calibration standards are prepared from NBS-traceable, EPA certified, or primary standard materials. Daily logs are maintained to monitor instrument response to a given standard.

Quality Control Test Samples

Routine quality control samples to be analyzed concurrently with client samples are a significant portion of the RAS laboratory quality control programs. The purpose of these checks is twofold: 1) to assure that samples being analyzed satisfy predetermined standards of accuracy, and 2) to measure and document achieved levels of accuracy and precision.

There are many different types of quality control samples which could be used for these purposes. The correct combination of these will depend on the complexity of the test method and the desired degree of accuracy. The following quality control parameters are general considerations for Radian's quality control for test methods.

Interferences

The analytical results of a test method might be affected by interferences from the glassware, solvents, reagents, or the sample matrix. Blank samples which are subjected to conditions similar to samples being analyzed are used to evaluate the purity of laboratory reagents. The frequency of blank analysis is method dependent. For example, a laboratory or field blank is analyzed after each GC/MS volatile organic analysis with high levels for any of the pollutants. Ten percent of the samples from a

given sample batch are spiked with a known standard. Spike recovery data are calculated to determine matrix interference.

Precision

The precision or repeatability of a test method is required for proper interpretation and weighting of the data. Replicate samples or standards are used to determine the precision on a regular basis. The precision of multiple analyses are compared against predetermined precision limits to determine their acceptability. The precision is usually reported as a standard deviation or repeatability statistic and often depends on the concentration of the parameters analyzed. Replicate analyses are defined as separate digestions or extractions of the same sample, when possible. The percentage difference or range between replicate analyses is also used to monitor precision.

Reproducibility

The reproducibility of a test method refers to the repeatability over a period of time. How well will analytical results repeated a month later agree with today's results? Reproducibility can be measured by the repeated analysis of samples from a previous time period or by analysis by more than one laboratory or laboratory technician.

Qualitative Specificity

In the analysis of complex sample matrices containing multiple components, the use of a single method can lead to misidentification of compounds. The misidentification can be detected by repeated analysis of standards containing the compounds of interest or by independent analysis by a more specific method. For example, mass spectral confirmation can be used to evaluate misidentification problems in the GC laboratory.

2.6 Documentation and Data Handling

Documentation of methods, procedures, and results is an essential aspect of a QA/QC program.

Adequate documentation is required for an instrument maintenance system. RAS laboratories use an individual logbook, which is kept at each instrument, to record all calibration and maintenance activities. This logbook gives a chronology of that instrument's installation, operation, calibrations, maintenance, malfunction, and repairs. An accompanying binder includes all pertinent manufacturing information, service manuals, and similar reference materials.

Directions for calibrations and maintenance, along with appropriate forms and checklists, are maintained in a manual accompanying the logbook. The directions specify the required frequency for calibrations and maintenance, the tolerances for calibrations, and the action to be taken when calibration requirements are not met.

In this system, there is a single source for reference purposes as well as record keeping. All the instrument logbooks are reviewed periodically by the quality assurance coordinator and laboratory manager. A record of these logbook checks is maintained by the QA coordinator.

Work sheets have been developed to insure consistent laboratory data entry for most parameters determined in the laboratories. These sheets are designed to organize the data in a clear and logical manner, and to simplify calculations. The work sheets are divided into various sections including a section for reporting calibration standards and blank values and a section for plotting calibration curves. These work sheets are usually a standard data entry form which the laboratory technician enters in his/her bound lab notebook. When automated calibration is not applicable, electronic calculators are available in the laboratories to generate calibration curves by the method of least squares. Thus errors in reading calibration curves and calculating data are minimized. After an analysis

RADIAN

is completed and a data sheet filled out, the laboratory manager checks the data for completeness and approves the data sheet. After the data have been entered into the SAM system, an updated data sheet is issued to the laboratory manager. When the work is complete, a preliminary report is printed and distributed to the contributing laboratory managers for the final data check and approval. A final report is printed, certified by the laboratory manager, and forwarded to the client.

Proper documentation of quality assurance and quality control activities is an essential requirement. Documentation is needed to demonstrate that quality control activities were completed as scheduled and to communicate the results of the QC tests to laboratory managers and clients. Documentation of QA results is required to provide feedback for improvement of quality control programs.

Quality control documentation should be timely in order for feedback to occur. Daily reporting to laboratory managers is mandatory. Forms are designed to organize the QC data in a clear and logical manner, and to simplify calculations. Control charts are another excellent tool for summarizing quality control test results.

As part of Radian's QA audit program weekly reports summarizing audit results in the laboratories are prepared and distributed to QC coordinators.

3.0 Quality Assurance Audits

The quality assurance audit program of the RAS laboratories is conducted by the RAS QA Coordinator in conjunction with the corporate QA Director. The program consists of the following:

- QA standards are prepared using EPA certified standards, NBS standards, primary standard materials, and NBS-traceable compounds. All standards preparations are recorded in the QA Sample logbook (Figure 3-1).

RADIAN

- An inventory of stock standards is maintained within the limits of published stability data. This decreases the time required for daily standard preparation.
- Duplicate samples are requested from clients. These are blind to the laboratory and the client is not billed for the duplicate.
- Blind QA samples are submitted through the Sample Control Center to all laboratories. The parameters and concentration levels are selected by the RAS Quality Assurance Coordinator.
- Laboratory managers submit, via a "QA Alert Form" (Figure 3-2), a list of the types of QA samples needed the following week. This insures that the parameters with which there have been problems are included in the sample.
- Monthly reports are issued from the RAS QA Coordinator (Fig. 3-3). These are submitted to the corporate QA Director, laboratory managers and Director of RAS. Managers are notified immediately of major problems with the results of analysis of a QA sample.
- The results of the program are summarized on a quarterly basis for Radian's management.

In addition to the continuous audit program, provisions for third party review are made with each client's work. Radian Analytical Services welcomes onsite audits, performance samples, and independent evaluations.

Figure 3-3. Monthly QA Report

3.1 Data Review and Validation

All analysis results are entered into the SAM computer system. Following completion of the analyses, a preliminary report is printed and returned to the appropriate laboratory manager for review and validation. A final report is printed after the certification by the manager. This report is signed and approved by the laboratory manager before being forwarded to the client. The following diagram (Fig. 3-4) illustrates the data flow for a typical sample analysis.

Upon completion of the analysis and before the final data are issued, the results of the QA audit samples are compared to the certified values. These results are plotted on control charts. Separate control charts are maintained for each analysis. If results are outside the accepted control limits, the analytical results are held until the problem is resolved.

3.2 Control Charts

Quality control charts are maintained for both accuracy and precision. Both charts are structured as shown in Figure 3-5. The main portions of the chart are the center line and the two control limits. The center line is the 100% or total recovery/total agreement of analytical results. The upper and lower control limits are calculated from historical data.

Control charts for accuracy are constructed as follows:

Percent recovery of standards (P_{ST}):

$$P_{ST} = \frac{\text{analyzed value}}{\text{certified value}} \times 100$$

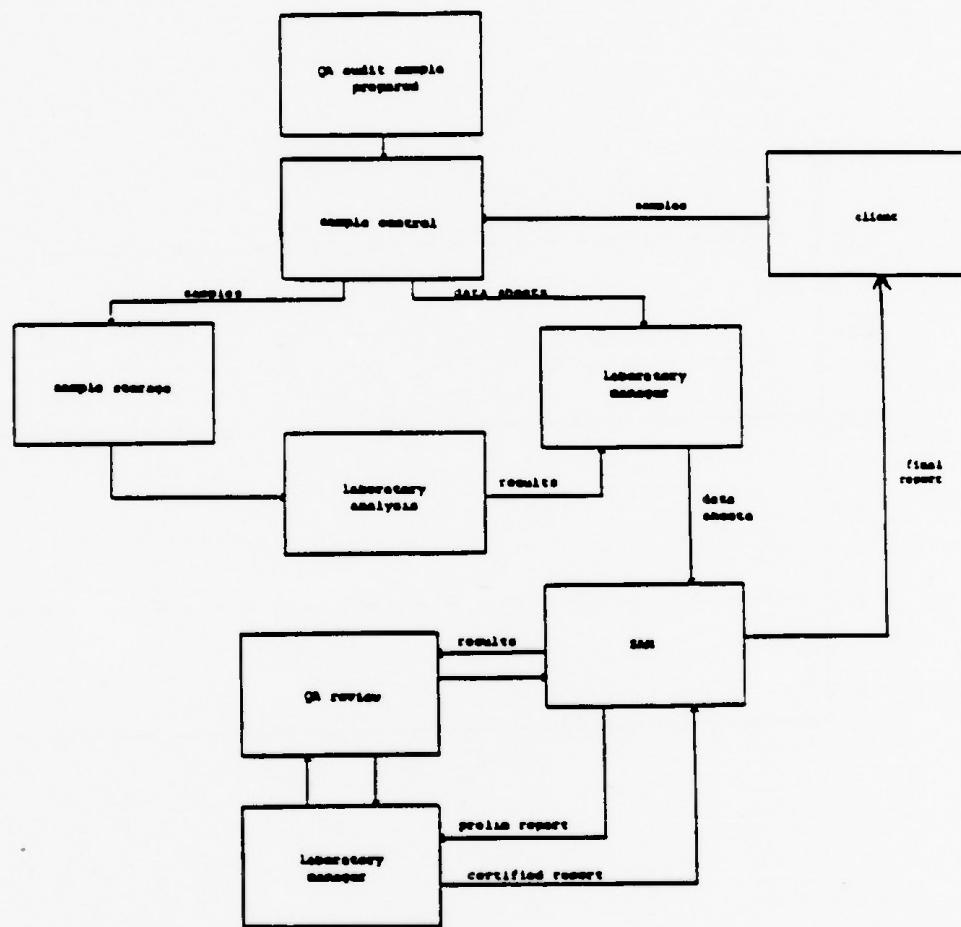

Figure 3-4. Data Flow

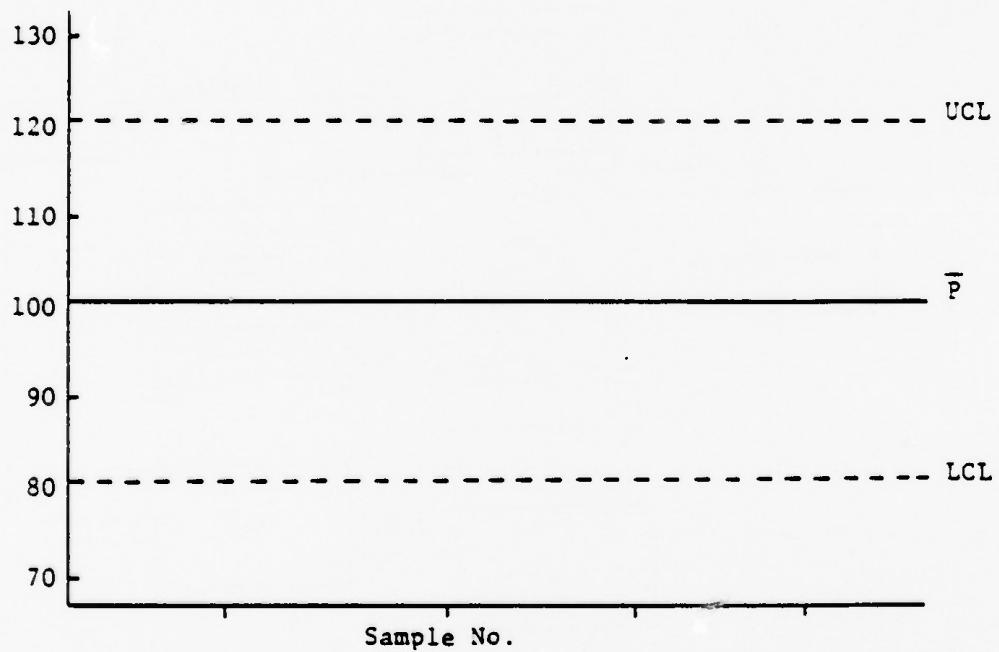

Figure 3-5. Control Chart

RADIAN

Percent recovery of spikes in samples (P_{SP}):

$$P_{SP} = 100 \times \frac{\text{analyzed value} - \text{background value}}{\text{spike}}$$

From a set of analyses, the average percent recovery (\bar{P}):

$$\bar{P} = \frac{\sum_{i=1}^n P_i}{n}$$

The standard deviation for percent recovery (S_R):

$$S_R = \sqrt{\frac{\sum_{i=1}^n P_i^2 - \left(\sum_{i=1}^n P_i\right)^2 / n}{n-1}}$$

The upper and lower control limits are therefore

$$UCL = \bar{P} + 3S_R$$

$$LCL = \bar{P} - 3S_R$$

An analysis is out of control when either of the two conditions apply:

- 1) Any results outside the control limits
- 2) Seven successive results on the same side of the control line.

Control charts for precision are also constructed. Precision is a function of the concentration range of the analyte. The closer the result is to the analytical detection limit, the more imprecise the data become on a percentage scale. Figure 3-6 illustrates the relationship between detection limit and precision for a typical methodology. Because of this concentration dependence, precision control charts need to be developed for specific concentration ranges for each analyte. For duplicate samples A and B, the ratio of the values of A and B are plotted.

RADIAN

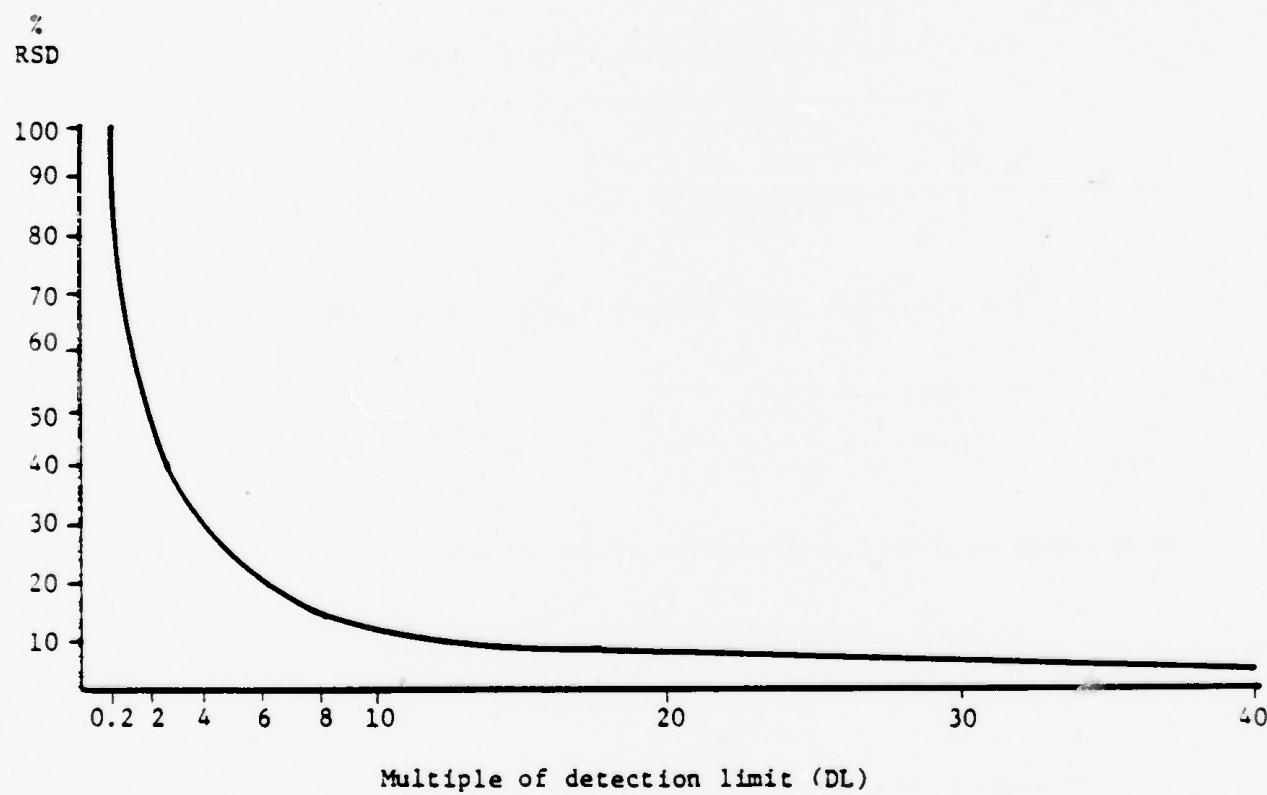

Figure 3-6. Relationship between Detection Limit and Precision

RADIAN

3.3 Concurrent Review

Upon review of analytical results of QA audit samples, the QA Coordinator will schedule a meeting with the laboratory manager if there are any tests out of control or which are deviant from an expected precision/accuracy norm. The purpose of this meeting is to:

- review raw data and determine if there is an explanation for the deviance.
- outline analyses of quality control and/or quality assurance samples to further define the problem and its solution.
- establish a schedule for monitoring the analysis after a solution is implemented, to assure that the problem does not recur.

Involvement of the laboratory manager in the problem assessment and solution is essential to a mutual commitment to a quality analytical laboratory.

Collector's Name Wayne Pearce Date/Time Sampled 3/19/84

Amount of Sample Collected Dust (Solid)

Sample Description Soil 45-46.5 ft BLS

Store at: Ambient 5°C -10°C Other _____

Caution - No more sample available Return unused portion of sample Discard unused portions

Other Instructions - Special Handling - Hazards Chloroform Hazard

 Hazardous sample (see below)

- Toxic
- Pyrophoric
- Acidic
- Caustic
- Other _____

 Non-hazardous sample

- Skin irritant
- Lachrymator
- Biological
- Peroxide

- Flammable (FP < 40°C)
- Shock sensitive
- Carcinogenic - suspect
- Radioactive

RE: F33615-83-D-4001, Order 11, Bergstrom AFB IRP Phase II, Stage 1
Analytical Quality Control Data Results

Dear Cpt. dePersia:

Enclosed is an advance copy of the analytical quality control data retrieved from the archived laboratory files. These data were requested by Modification No. 5 to subject Delivery Order for inclusion into the IRP Phase II Final Report. These data will be incorporated into the final report as an addition to Appendix H - Analytical Data.

As stated in our previous correspondence, the analytical work for this project was originally done in March-May 1984 and February 1985. Under then-current USAFOEHL guidance, no requirements were identified to segregate laboratory-internal quality control data by project or analysis set. The standard laboratory procedures were to log and store all such data by date, machine and/or analytical procedure. Specifically, the Bergstrom AFB IRP samples were often ganged with samples from other clients from chemical analysis. In general, the quality control objectives prevailing in the laboratory in 1984 and 1985 were met for samples analyzed as a complete lot. As we had also stated, the results of a diligent search for client specific data has resulted in a partial data set.

Some minor variations were noted between the analytical data as presented in the previous drafts of the report and the older raw data inspected during this records search. Please note that these are simply reporting errors. For example, several oil and grease values were originally reported as <100 ug/g and 470 ug/g. The archived data reviewed indicates the values should have been <900 and 4700, respectively. A review of all these data by the supervising geologist has concluded that the archived data do not significantly affect the conclusions of the report. Appropriate final report text or table modifications will be made to reflect any changes based upon the archived data.

The gathering of archived data always presents a serious problem when considering the age and volume of such data. Further, the retrieval of quality control data from this time frame was made difficult because of the relocation of the laboratory and corresponding warehoused records.

To se: sample -07 was spiked but the true value and recovery was not documented.
 Spike added value based on spike size calculated (39 was the only unknown value),
 but the calibration which standard was not determined but based on other data analyzed is the same than found
 and the percent recovery the true value is 0.018 ppm.

QC/QA Data Request

Sam® No. 84-04-119

Steve Madden

10/30/86

- 1) I was unable to find any standard notebooks, instrument log books, or analyst log books (work books) that gave any reference to the work performed in this work order.
- 2) Pesticides Analysis (608, including PCB's and DDT
 - a) I found 9 HP3390 chromatograms related to these analyses (Nos 14-22, inclusive)
 - 1) No integrator conditions are given, but it is obvious that an attenuation change was made between standard injections, run #14 and run #22
 - 2) Two standard injections were made: run #14 and run #22 - the first and last injections of the series
 - a) They are both logged as "2uL OC Pest Std 0.05 ug/mL"
 - b) The column is apparently mixed phase at 105°C (as given on an additional page in the folder)
 - c) No pesticide ID's are given (I have guessed on one copy)
 - d) Xerox copies of the standards are attached
 - 3) One Method Blank injection was made: run #15
 - a) It is logged as "2uL Method Blank 500mL -> five mL"
 - b) Xerox copy of this chromatogram is attached

RADIAN
CORPORATION

- b) Total QC/QA Data on Pesticides
 - 1) 2 pesticides standard chromatograms
 - 2) 1 annotated pesticide chromatogram (with ID's provided by me)
 - 3) 1 method blank chromatogram
- 3) Herbicides Analysis (2,4-D and 2,4,5-TP (Silvex))
 - a) I found 9 HP 3390 chromatograms related to this analysis (runs 23-31 inclusive)
 - 1) No integrator conditions are given
 - 2) One standard injection was made: run #23
 - a) It is logged as "2uL Herb Std .1 ug/mL"
 - b) The column is apparently the same as one for pesticides (mixed phase at 105°C)
 - c) No herbicides ID's; are given (I have guessed on one copy)
 - d) A Xerox copy of the standard chromatogram is attached
 - 3) One apparent method blank chromatogram was made: run #24
 - a) It is logged as "2uL MB-Herb 900mL ->5mL"
 - b) A Xerox copy of this chromatogram is attached

RADIAN
CORPORATION

b) Total QC/QA data on Herbicides

- 1) 1 herbicide standard chromatogram
 - 2) 1 annotated herbicides standard chromatogram (with ID's provided by me)
 - 3) 1 method blank chromatogram
- 4) Naled (Dibrom) Analysis

There is no data of any kind related to this analysis present in the folder.

QC/QA Data Request

Sam^{*} No. 84-05-059

Steve Madden

10/30/86

- 1) I was unable to find any standard notebooks, instrument logbooks, or analyst logbooks (workbooks) that gave any reference to the work performed in this work order.
- 2) Pesticide Analysis (608)
 - a) I found 11 HP 3390 chromatograms related to this analysis (runs #201-204, and 206-207 on 5/30/84, and run 1-4 on 6/1/84, and run 5 on 6/2/84)
 - 1) No integrator conditions are given
 - 2) Of the runs made on 6/1-2/84, three are unlabeled, but two appear to be standard injections. One is labeled, and one is not (runs 1 and 2 of 6/1/84)
 - a) The logged sample reads "2uL tests Std 0.05 ug/mL" (run #1)
 - b) No column information is given
 - c) No pesticide ID's are given, but could be the same as those tentatively identified by me, in the same manner, as case 84-04-119
 - d) Xerox copies of both standard chromatograms are attached
 - 3) One method blank injection was made: run #201 on 5/30/84
 - a) It is labeled "7uL MB 1L ->4mL Pest"
 - b) A Xerox copy of this chromatogram is attached

RADIAN
CORPORATION

- 4) One pesticide spike injection was made: run #202 on 5/30/84
 - a) it is labeled "2uL Spike Pest 1L -> 5mL"
 - b) in addition there are three analyst sheets describing decisions and spike calculations
 - c) The standard areas appear to be from run #1, 6/1/84
 - d) The spike areas seem to be from run #202 on 5/30/84
 - 1) The spiked amounts are apparently 0.05 ppb by both compounds (tentatively identified as alpha isomer-BHC and lindane - case #84-04-119)
 - 2) recoveries are indicated as 120% and 180% for two compounds
 - e) a Xerox copy of the standard injection is attached
 - f) Xerox copies of the analyst sheets are attached
 - b) Total QC/QA Data on Pesticides
 - 1) Two pesticide standard chromatograms
 - 2) One method blank chromatogram
 - 3) One spike chromatogram
 - 4) Three analyst sheets (work sheets)
 - 3) Herbicide Analysis (2,4-D and 2,4,5-TP)

RADIAN
CORPORATION

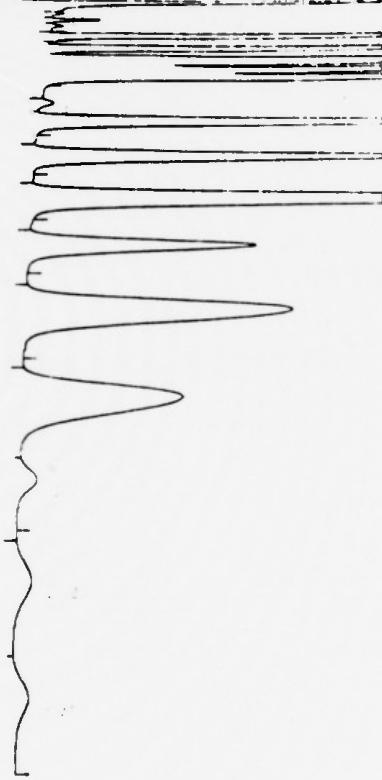

- a) I found 11 HP 3390 chromatograms related to this analysis (runs 20, 22-27 on 6 June 84, and runs 29-32 on 6/7/84)
 - 1) No integrator conditions are given
 - 2) Two standard injections were made: run #20 on 6/6/84 and run #29 on 6/7/84
 - a) Both chromatograms are labeled as "2uL HERB STD 0.1 ug/mL"
 - b) No column information is given
 - c) No herbicide ID's are given, but are presumably the same as those tentatively made, by me as on case 84-04-119
 - d) A Xerox copy of both standard injections is attached
 - 3) One method blank injection was made: run #22 on 6/6/84
 - a) It is labeled as "2uL MB 1L -> 5mL"
 - b) a Xerox copy of this chromatogram is attached
 - 4) One spike injection was made: run #23 on 6/6/84
 - a) It is labeled as "2uL HERB SPIKE !0ug/mL 1L -> 5mL"
 - b) a Xerox copy of this chromatogram is attached
 - 5) One analyst worksheet is included that describes analyst decisions
 - a) A Xerox copy of this sheet is attached

- b) Total QA/QC Data on Herbicides
 - 1) 2 Herbicide Standard Chromatograms
 - 2) 1 Herbicide Method Blank Chromatogram
 - 3) 1 Herbicide Spike Chromatogram
 - 4) 1 Analyst Worksheet
- 4) Naled (Dibrom) Analysis

There is no data of any kind related to this analysis present in the folder

Chromatographic Conditions

EPA Method 601 - Column 1 conditions: Carbopack B 60/80 mesh coated with 1% SP-1000 packed in an 8 ft. x 1/8 in. OD glass column with helium carrier gas at a 40 mL/min. flow rate. Column temperature held at 45° for 3 min. then programmed at 8° C/min. to 220° and held for 15 min. Instrument detection = 0.1 ug/L.

EPA Method 601 - Column 2 conditions: Porasil-C 100/120 mesh coated with n-octane packed in a 6 ft x 1/8 in. OD glass column with helium carrier gas at 40 mL/min. flow rate. Column temperature held at 50° C for 3 min. then programmed at 8° C/min. to 170° and held for 4 min.

EPA Method 602 - Column 1 conditions: Supelco 100/120 mesh coated with 5% SP-1200 and 1.75 % Bentone-34 packed in a 6 ft.x 1/8 in. OD glass column with helium carrier gas at 36 mLs/min flow rate. Column temperature held at 50° C for 2 min. then programmed at 6° C/min to 90° C for a final hold. Instrument detection limit = 0.5 ug/L.

EPA Method 602 - Column 2 conditions: Chromosorb W-AW 60/80 mesh coated with 5% 1,2,3-Tris(2-cyanoethoxy)propane packed in a 6 ft. x 1/8 in. OD glass column with helium carrier gas at 30 mLs/min. flow rate. Column temperature held at 40° C for 2 min. then programmed at 2° C /min. to 100° C for a final hold.

Second column confirmation was performed on workorder # 84 03 205 samples -01, -02, and -04 for method 602. All results reported for benzene and ethylbenzene were confirmed qualitatively. A quantitative confirmation is not performed by second column.

THOMAS W. GRIMSHAW

EDUCATION:

Ph.D., Geology, University of Texas at Austin, 1976.

M.S., Geology, University of Texas at Austin, 1970.

B.S., Geological Engineering, South Dakota School of Mines and Technology, 1967.

EXPERIENCE:

Program Manager, Radian Corporation, Austin, TX, 1984-Present.

Division Manager, Policy and Environmental Analysis Division, Radian Corporation, 1982-1984.

Department Head, Environmental Analysis Department, Radian Corporation, 1978-1982.

Group Leader, Radian Corporation, 1976-1978.

Teaching Assistant, The University of Texas at Austin, 1974.

Captain (R&D Coordinator), U.S. Army, 1970-1972.

Geologist, Junior Grade, Amoco Production Company, 1969-1970.

Geologic Field Assistant, Amoco Production Company, 1967.

Certification: AIPG Certified Professional Geologist No. 4425

FIELDS OF EXPERIENCE:

As Program Manager at Radian, Dr. Grimshaw has overall responsibility for the technical, fiscal, and schedule aspects of several solid/hazardous waste, ground-water, and other environmental projects. For these projects, he serves as the primary point of contact for the clients sponsoring the work. Dr. Grimshaw is also responsible for marketing and preparing proposals for Radian services in a variety of areas, including solid/hazardous waste site investigations, remedial action planning and implementation, ground-water contamination studies, multidisciplinary environmental studies, and reclamation investigations.

Most recently, Dr. Grimshaw has served as Program Manager (PM) for solid/hazardous waste disposal investigations at seven U.S. Air Force bases in Texas,

12/05/84

Thomas W. Grimshaw

Oklahoma, Louisiana, and New Mexico. These projects, which are being performed for the USAF Occupational and Environmental Health Laboratory, Brooks AFB, Texas, are an integral part of the Air Force Installation Restoration Program. Each investigation includes soil sampling and analysis, monitor well installation, and surface water sampling and analysis. The resulting data are interpreted in terms of degree of soils, ground-water, and surface-water impacts, and recommendations are made for investigations for defining remedial measures to be undertaken.

Also for the Air Force, Dr. Grimshaw is PM for wastewater investigations at Kelly AFB and Laughlin AFB, Texas. The study at Kelly AFB is to determine the source and characteristics of industrial wastewater and other inflows to the storm sewer system and to make recommendations for redirecting these flows to the industrial wastewater treatment plant. The investigation at Laughlin AFB is a comprehensive evaluation of the effectiveness of the existing wastewater treatment system accompanied by recommendations for required changes to the system.

Dr. Grimshaw is also PM for an ongoing task order contract for a large IBM manufacturing plant in Austin, Texas. This contract is for sampling, analysis, and related services for ground-water monitor wells, wastewater streams, and other sources in the plant.

For a major law firm in Kansas City, Missouri, Dr. Grimshaw is serving as PM for a program to provide Expert Witness and corollary services related to a hazardous waste disposal site in Kansas City. A lawsuit has been filed against the four largest Potentially Responsible Party generators and the owner/operator by the U.S. Department of Justice (who received the case by referral from the U.S. Environmental Protection Agency). Radian is working with the law firm representing the former owner/operator of the site.

Expert support is being provided in the following areas: 1) oversight of Remedial Investigation and Feasibility Study activities by the U.S. EPA and the PRP generators; 2) review of depositions and recommendations for line of questioning by the attorneys; 3) support of automation of disposal records with the objective of developing a basis for allocation of investigation and clean-up costs ; 4) prepare and give technical presentations on the case to the attorneys involved; and 5) prepare and execute work plans to on-site technical studies to be undertaken at the site.

The Western Company of North America, Fort Worth, Texas is an oil field servicing firm whose operations generate hazardous wastes. Dr. Grimshaw is PM for a program being performed for the Western Company to achieve compliance with Texas Department of Water Resources regulations at three of their sites in Kermit, Odessa, and Rankin. Activities for this program to date have included preparation of a Plan of Action for obtaining compliance and a Waste Analysis plan, both of which have been submitted to TDWR for approval.

12/05/84

RADIAN
COMPONENTS

Thomas W. Grimshaw

Dr. Grimshaw is PM for a site investigation and remediation for a pesticide-contaminated site in Arizona owned by University Financial Investors Corporation. This project has included soil sampling and analysis for pesticides, remedial plan preparation, and presentations to state and EPA regulatory authorities.

Dr. Grimshaw has served as Technical Coordinator for over 40 risk assessment surveys for Environmental Impairment Liability (EIL) insurance policies. The purpose of these surveys is to provide EIL insurance underwriters the data needed for assessing the risks involved in providing insurance coverage for the facilities surveyed. Dr. Grimshaw also personally performed six EIL surveys involving facilities at more than 30 locations around the country. These facilities included a hazardous waste landfill, numerous industrial and municipal wastewater treatment plants, a municipal landfill, an aluminum forging plant and a casting plant, a magnet wire production facility, and several paper mills.

Dr. Grimshaw was Project Director for an investigation of an unpermitted disposal site located near Dallas, Texas. This project, which was performed for a major law firm in Dallas, included extensive waste and soil sampling and analysis, delineation of specific sites of disposal, and recommendations for disposition of the waste materials found. Several meetings were held with the regulatory agency, the Texas Department of Water Resources.

In another investigation for the same law firm, Dr. Grimshaw was Project Director for a soil sampling and analysis and ground-water monitoring project at a PCB disposal site. The area of contamination was defined by surface and shallow subsurface soil sampling on a modified grid pattern, and two monitor wells were installed. A recommendation involving soil removal, redepositing, and pavement was made to address the PCB contamination at the site.

For a large program conducted for International Paper Company, Dr. Grimshaw served as Technical Coordinator for developing Closure Plans for impoundments at wood treatment plants in three states. This program included a full complement of studies to define the existing situation and prepare a plan of remedial action for each plant. The initial activity was the sampling and analysis of pond supernatant and sludge, subsoil, and ground water. Bench-scale stabilization studies were performed on the sludge using a number of candidate commercial stabilizing compounds. Several closure alternatives were developed and screened, and a set of alternatives was selected for inclusion in conceptual plans. After the conceptual plans were approved by the client and the regulatory agencies, a detailed design was prepared and specifications developed.

For Tuloma Energies, Inc., Radian performed a program directed by Dr. Grimshaw for development of a commercial Hazardous Waste Management Facility in north-

RADIANT
CORPORATION

Thomas W. Grimshaw

eastern Oklahoma. During the initial phases of this project, a market analysis was performed to determine the sources at waste that could potentially use the new facility. Subsequently, a regional screening analysis was performed to identify areas most likely to have suitable sites for the new facility. This analysis included screening for several factors, including hydrologic, geologic, topographic, ecologic, and aerometric characteristics as well as population density. Dr. Grimshaw assisted Tuloma Energies in coordinating with the state regulatory agency (Oklahoma Department of Health) during the initial phases of the project.

Dr. Grimshaw was Project Director for two programs for International Paper Company to evaluate the potential risk of proposed solid waste management plans for paper mills in Arkansas and Mississippi. These programs included collection of waste, soil, and ground-water samples, analysis of the wastes, and batch extraction of the wastes followed by analysis of the leachates. In addition, leachates were generated and attenuated in waste and soil columns to evaluate the capacity of the subsoil to attenuate any leachate that might escape from the disposal site. A ground-water flow model was used to assess the rate and direction of contaminant movement if contaminants were to reach the water table.

Dr. Grimshaw was Technical Director for a generic environmental assessment of wastes from fluidized bed combustion for the U.S. Environmental Protection Agency (EPA). Emphasis was placed on potential hydrologic impacts. Both laboratory studies and field lysimeter tests were conducted in the study. The objectives were to identify and investigate key variables which determine the acceptability of FBC waste disposal and to establish a reliable empirical correlation between laboratory and field results so that better conclusions on field effects can be drawn on the basis of laboratory studies. Since the regulatory situation for FBC wastes was unclear during conduct of the program, provisions were made for both the eventuality that leachate migration will be allowed in the substrate below the landfill and that leachate escape will be controlled by liners. Interactions between leachate and representative disposal media and between leachate and several candidate liner materials were investigated in laboratory studies.

Dr. Grimshaw was also Technical Director for a program to investigate the ground-water impact of a spill of a coal-distillate liquid fuel at an SRC-II (Solvent Refined Coal) pilot plant at Fort Lewis Military Reservation near Tacoma, Pierce County, Washington. The study involved detailed coring to establish the location and extent of unsaturated zone contamination and designing and constructing a set of ground-water monitoring wells to define the extent of ground-water contamination that had occurred. Analytical chemistry support was provided for Resource Conservation and Recovery Act (RCRA) Extraction Procedure testing of contaminated soils and for ground-water quality evaluation. A Remedial Measures Plan was formulated and implemented to remove

12/05/84

Thomas W. Grimshaw

contaminated material and to prevent the further spread of ground-water contamination. This program involved extensive coordination and interfacing with the states regulatory authority (Washington Department of Ecology).

In a follow-up program for which Dr. Grimshaw was again Technical Director, Radian evaluated the overall hydrogeologic impact of the entire SRC plant in addition to the spill area. This program again involved soil sampling, extraction, and analysis as well as water quality monitor well installation and sampling. A zone of contamination was identified, and a comprehensive Remedial Measures Plan was prepared to address the problem.

In a program for Utah International, Incorporated, Dr. Grimshaw was responsible for evaluating the implications of RCRA on the company's mining operations under various regulatory scenarios. Special reference was made to UI's proposed Springer Mine which is in Pershing County, Nevada. Several issues concerning the application of RCRA regulations to metal mines emerged, including the applicability of the procedure for classifying solid waste as hazardous or non-hazardous.

Dr. Grimshaw was Technical Director for a project to investigate the environmental feasibility of disposing of flue gas desulfurization (FGD) wastes, ash and sludge, from a mine mouth power plant by backfilling into the associated surface mine in northwestern Colorado. He also had major supervisory and hydrogeologic interpretation roles in the second phase of the program, which included extensive field studies. These field studies included infiltration tests of the mine floor and overburden, water balance investigations to estimate ground-water recharge, and emplacement of piezometers to ascertain the direction of ground-water flow. A major output of this program was a rating of the various parts of the large surface mine in terms of suitability for ash and sludge disposal.

Dr. Grimshaw was a Task Leader in a program for the EPA ground-water laboratory (Robert S. Kerr Environmental Research Laboratory) to investigate a technique for identifying sources of nitrate ions in ground waters and soils using stable nitrogen isotopes. The usefulness of nitrogen isotope ratios for differentiating sources of nitrate pollution (septic tanks, feedlots, barnyards, and lands receiving municipal waste waters) was evaluated. Standard statistical techniques were used to analyze the observed variations in nitrogen isotope values, with respect to several nitrate-ion sources and various environmental factors.

For a comprehensive environmental assessment for Shell's Milam Mine near Rockdale, Texas in Texas, Dr. Grimshaw prepared and conducted an aquifer test program. These efforts included design of the pump wells and piezometers, layout of the well configuration in the field, oversight of well drilling operations, conduct of the two pump tests, and interpretation of the results in terms of the basic aquifer parameters. In another project related to this mine,

Thomas W. Grimshaw

Dr. Grimshaw was responsible for evaluating the potential effects on ground water resulting from disposal of ash and FGD solids from a power plant by emplacement of the wastes in the mine.

Dr. Grimshaw has directed or prepared parts of numerous multidisciplinary environmental investigations. The major projects of these type are as follows:

- o EIS for Improvement of the City of San Antonio Wastewater Treatment System
- o EIS for Upgrade of the City of Greensboro, NC Wastewater Treatment System
- o EA for the Sandow Four Lignite-Fired Generating Station, Milam County, Texas
- o Preliminary EA for a Proposed Lignite Mine in Henderson and Anderson Counties, Texas
- o Hydrology-Related Regulatory Risks for Lignite Mining at the Deadwood-Shiloh Prospect, Texas and Louisiana
- o EA for a Proposed Olefins Complex near Sweeny, Texas
- o Environmental Audit of the Geokinetics In-Situ Oil Shale Operation, Uintah County, Utah
- o Environmental Support Studies for a New Coal Gasification Facility at the Celanese Chemical Plant, Bishop, Texas
- o Environmental and Reclamation Support Studies for a Proposed Lignite Mine in Freestone County, Texas

Prior to his employment by Radian Corporation, Dr. Grimshaw was employed as an oil and gas exploration geologist by Amoco Production Company, Denver, Colorado. Initially, he was a geologic field assistant near the coast of the Gulf of Alaska. This work entailed measuring, describing, and collecting stratigraphic sections in the Tertiary rocks in the vicinity of Cordova and Cape Yakataga, Alaska. Subsequently, Dr. Grimshaw was involved in a gas and petroleum exploration program in north central Montana. Most of the effort was in working out the stratigraphy and structural geology in the area of investigation, and he served for a time as well-site geologist on gas exploration wells. In addition, he launched a program of regional exploration in a much larger area in Montana. This work included study of down-hole geophysical logs, preparation of structural contour maps, and assembly of isopachous maps.

RADIAN
CORPORATION

RICK A. BELAN

EDUCATION:

M.S., Hydrology, University of Arizona, Tucson, 1972.

B.S., Geology, Kent State University, Ohio, 1970.

EXPERIENCE:

Staff Hydrogeologist, Radian Corporation, 1980-Present.

Groundwater Hydrologist, William F. Guyton and Associates, 1977-1980.

Captain, United States Army, 1972-1977.

Environmental Impact Assessment Officer, United States Army, 1975.

Research Associate, University of Arizona, 1970-1972.

FIELDS OF EXPERIENCE:

Mr. Belan is currently the field investigation director for the Installation Restoration program at Sheppard Air Force Base, Texas; and is also acting as the technical advisor to the overall project. The investigation is being conducted at 4 inactive hazardous waste sites, and entails the emplacement of 14 monitor wells and 3 coreholes about these sites. These are to obtain soil and groundwater samples for chemical analyses. The results will be used to determine the environmental impact of the waste sites on the local groundwater systems.

Reports indicated the possible existence of groundwater contamination off base at McClellan Air Force Base, California. This large hydrogeological program was to investigate the present groundwater conditions. As the geologic evaluation task leader for the project Mr. Belan designed, coordinated and supervised the field activities for 29 reconnaissance borings. This required the drilling and sampling (soil and groundwater) to a depth of about 200 feet at selected sites off base. Selected chemical analyses were performed to maximize the hydrogeological information under this program. These borings were successfully completed ahead of schedule under difficult field conditions and project constraints.

As the Project Director Mr. Belan assisted a commercial client as part of litigation activities in developing groundwater sampling protocols which were then implemented under the direct field supervision of him. Two groundwater sampling episodes were conducted at the client's California site. The samples were obtained from a number of monitor wells for selected organic, inorganic and bacteriological analyses.

12/04/84

Rick A. Belan

In Maryland an underground gasoline storage tank had leaked into the subsurface which was located in an urban downtown area. Mr. Belan as the principal investigator conducted an on-site visit and data review to confirm the nature and amount of the gasoline leak, assess the impact on the local hydrogeological setting, and possible safety implications. The results were documented along with recommendations for further evaluation of the leak.

A commercial client in southern California requested a geological evaluation of 10 inactive hazardous waste pits. Mr. Belan as the geological and safety task leader provided the coordination of coring activities through the waste bodies. This included obtaining soil, waste and air samples for chemical analyses from 10 coreholes. Full personnel protective clothing and respirator equipment were required for these activities.

Mr. Belan conducted field investigations of various hazardous waste sites at Kelly and Tinker Air Force Bases in Texas and Oklahoma, respectively. These efforts, as part of the Air Force's Installation Restoration Program (IRP), entail the installation of monitoring wells and hazardous waste site soil sampling for chemical analysis. The results were used to define the site hydrogeology and waste site impacts, if any, on the local groundwater system.

Mr. Belan is the hydrogeological project director for an Installation Restoration Program investigating four hazardous waste disposal sites at Hill Air Force Base, Utah. The field phase entailed the direction of the investigation efforts for monitor well installation and completion, soil and groundwater sampling, geophysical resistivity surveys and chemical analysis coordination. The results of this effort were to determine the nature and extent of groundwater contamination and define the local hydrogeology.

As part of a remedial actions assessment of the McColl hazardous waste site in California, he conducted the conceptual design and evaluation of a slurry trench wall system. Containment wall materials were selected for laboratory testing. Additional wall materials and installation costing, survivability, and suitability were evaluated. Prior investigation at the site entailed the coordination and supervision of the air rotary drilling and casing drive completion of a 270-foot monitoring well. This upgradient well was drilled in difficult caving formations. The successful completion of this well permitted the location of a final downgradient monitoring well for the client.

Mr. Belan conducted, as part of a remedial actions assessment of the Lipari Superfund site in New Jersey, the conceptual design and costing of a dewatering system. This included an impact assessment of the formations dewatering on a slurry trench cutoff wall. The results of this evaluation provided discharge information for a groundwater treatability study.

He worked on three Environmental Protection Agency Superfund projects. Two projects entailed the hydrogeological evaluations of hazardous waste sites in Louisiana and New Jersey with the results developing and supporting site

Rick A. Belan

remedial measures activities. The third EPA Superfund activity was the evaluation of a new potential waste isolation technology which had been tested. The test attempted to isolate a large block of soil by slurry injection at depth areally and vertically using a patented process. Mr. Belan supervised the site investigation for determining the success of the technique to isolate the soil block. This entailed directing a geophysical survey, and confirmation soil borings to determine the soil isolation success of the test and report documentation.

In the area of solid waste management, Mr. Belan coordinated, supervised, and documented the disposal of fluidized bed combustion byproducts from a synfuels experiment sponsored by the Environmental Protection Agency. This project entailed the coordination with local agencies for the disposal at an appropriate landfill, and hydration of the wastes to neutralize its exothermic reaction prior to disposal.

Mr. Belan was instrumental in providing a hydrogeological assessment of an inactive hazardous waste site in south central New York. The site is listed by EPA as a priority site for action under Superfund. The result of the assessment was the design and costing of a monitoring well program for the client.

As the environmental baseline task leader and geological/hydrogeological team member, Mr. Belan coordinated, developed and identified environmental constraints or issues for a New Mexico Synfuels Project Feasibility Study. Analysis for this study for an industrial client permitted enumeration of groundwater and surface-water environmental issues associated with two in-mine and two plant sites disposal of hazardous/nonhazardous solid waste from a synfuels plant. The results of the study summarized the regional and site-specific geology, groundwater and surface-water. The study identified mine and plant environmental constraint areas concerning solid and liquid waste disposal and also described the waste disposal options as to which mine or plant sites the solid waste should go.

Mr. Belan conducted as part of a geothermal feasibility study a hydrogeological assessment of two aquifers for potential utilization for each of four U.S. military bases which are located in the vicinity of San Antonio, Texas. This entailed the development of conceptual well depths, productivity estimates, static water levels, water temperatures and water quality. These data were used to support benefit/cost analyses of a total geothermal systems package that included costs of well completion and production, heat extraction systems and projected heat demands.

He completed a state-of-the-art review of geopressured/geothermal fluids disposal technologies and environmental problems associated with the disposal techniques for the Texas Energy and Natural Resources Advisory Council (TENRAC). The two primary disposal methods reviewed were injection wells and

12/04/84

RADIAN
CORPORATION

Rick A. Belan

surface discharge. From this study, Mr. Belan developed areas of geopressed/geothermal fluids gaps to commercialization. This review and subsequent recommendations provided TENRAC with a means to evaluate Texas geothermal/geopressured development especially towards commercialization and of potential technology areas that merit further study with public funds.

Mr. Belan conducted a preliminary assessment of the feasibility of utilizing a deep injection well for disposal of hazardous waste fluids from a prospective lignite gasification plant in East Texas. This entailed identifying aquifer parameters and computing long-term injection affects in order to assess two candidate aquifers for potential injection horizons.

As a staff hydrogeologist at Radian, Mr. Belan has experience in a wide range of groundwater sampling and analysis efforts. He was the field task leader and hydrogeological analyst for an environmental constraint study of a Lurgi coal gasification plant in East Texas. The study was to be the basis of a solid waste management plan for the plant site and the selection of a solid waste disposal site. It provided the client with supporting information to be used in obtaining state permits. Mr. Belan was the task leader for coordinating the air quality, ecology, surface water, and cultural impact portions of the reports, and developing future site-specific environmental studies requirements.

Mr. Belan analyzed aquifer testing methods and parameter data for an in-situ coal gasification project in Wyoming providing regional and vertical characteristics of the coal and overburden aquifers. The results became part of a relicensing application prepared for the U.S. Department of Energy, Laramie, Wyoming.

At refinery waste disposal sites in the area of Kenai, Alaska, Mr. Belan conducted a hydrogeological evaluation. This entailed the field supervision and interpretation of the drilling, geologic sampling, construction, and groundwater sampling of monitor wells in and around the disposal sites. The data obtained was used to define the local groundwater systems, subsurface geology, and establish if any groundwater contamination had occurred.

Mr. Belan directed and conducted the production and injection testing of two geothermal wells at Navarro College, Corsicana, Texas; one well was to supply geothermal fluid for heat extraction and the other will be used for disposal of the same fluid. He analyzed the test data for well performance, and aquifer parameters; providing a report and recommendations before final geothermal system design.

Mr. Belan, at Radian, conducted an impact assessment of groundwater availability and development quantitatively and qualitatively for a proposed petrochemical complex near the Texas Gulf Coast. His work involved developing

12/04/84

Rick A. Belan

a hypothetical well field for producing 6,900 gallons per minute and assessing the groundwater effects with time for varying aquifer conditions. Mr. Belan analyzed the local groundwater qualities to establish present baselines and if sufficient quality plant water could be available for use by the proposed plant.

He assisted in the preparation of the geology and groundwater hydrology sections of an Environmental Information Document for a proposed lignite mine in East Texas. He worked extensively on the supervision of the drilling, electrical logging, sampling, and construction of the test and monitor wells associated with this program with his former employer and, presently, with Radian prepared the study results for inclusion into the report.

As a groundwater hydrologist with W. F. Guyton and Associates, Mr. Belan provided hydrogeological field support for an overland liquid disposal facility for a client in Louisiana. In order to define the hydrogeology in and around the disposal facility, Mr. Belan provided the field supervision and interpretation of the mud rotary drilling, logging, completion, development, and groundwater sampling of a series of monitor wells. This information aided in defining what impacts, if any, the overland disposal would have on the local groundwater system.

Also while Mr. Belan was working for W. F. Guyton and Associates, his varied field tasks took him to Arizona, Nevada, and Texas. He assisted three large utility power companies in the field supervision of the drilling, geophysical logging, construction, pump and aquifer testing, and water quality sampling of over twenty large production water wells along with a number of observation wells. These wells were drilled on the different jobs by cable tool, mud rotary, and reverse drilling methods. These activities were summarized in well completion reports.

Mr. Belan completed with Mr. Guyton an in-depth analysis of the hydrogeology of the property of Texas Electric Service Company for Texas Utilities Services, Inc. for a prospective water supply, along with a well inventory of property outside the client's area of interest. During this study proposed water well field proposal consisting of 38 production water wells for a projected new electrical generating station. This study included estimated pumping rates, depths of wells, and estimated initial water quality for the well field.

As an officer in the United States Army stationed in West Germany in 1975, Mr. Belan initiated, developed and provided Environmental Impact Assessments (EIA) for the U.S. Frankfurt Military Community, and initiated research for 44 U.S. military installations throughout West Germany, which were to be included in the Frankfurt Master Plan. These studies were to define the environmental problems, if any, of the military installations for remedial measures planning

Rick A. Belan

and budgeting. His earlier duties included terrain/soils trafficability studies and weather analysis, and the supervision, evaluation, and distribution of tactical information.

As a Graduate Research Assistant in the Department of Soils, Water and Engineering at the University of Arizona, Mr. Belan was responsible for the planning, research, development, and quantifying of Mountain Front Recharge of the Tucson Santa Catalina Mountains under the supervision of his thesis director. The results of the study were published in an Arizona Water Resources periodical.

12/04/84

E. WAYNE PEARCE

EDUCATION:

M.S., Geology, University of South Florida, 1984.

B.S., Geology, Florida Atlantic University, 1976.

EXPERIENCE:

Hydrogeologist, Radian Corporation, Austin, TX, 1980-Present.

Hydrogeologist, Edwards Aquifer Research and Data Center, 1980.

Hydrogeologist, Geraghty & Miller, Inc., 1977-1980.

FIELDS OF EXPERIENCE:

At Radian Corporation, Mr. Pearce has served as a hydrogeologist in the Environmental Analysis Department. Duties included project direction and team member responsibilities.

As a project director, Mr. Pearce has had responsibility for technical quality, budget controls, and scheduling for major projects, primarily in the investigation and mitigation of hazardous waste disposal sites. Among these projects, Mr. Pearce directed the geotechnical investigation and waste sampling efforts at the McColl waste site in southern California. Related to the same project, Mr. Pearce also directed the proposal effort, authored several reports on the site, assisted in the remedial action cost-effective evaluation and recommendation, and directed the field effort that demonstrate the recommended remedial action was feasible and could be accomplished safely.

In a similar California project for an industrial client, Mr. Pearce directed a project which investigated a disposal site on the client's property. The unstable site required special supports for drilling activities and personnel. The project included waste sampling areally and vertically to define the site characteristics, soil sampling below the waste, undisturbed site emissions monitoring, disturbed waste emissions monitoring, ground-water monitoring well installation and sampling, and investigation of other suspected disposal areas on-site. A remedial action is currently being developed for this site.

Other projects include:

- o Design of the conceptual ground-water remedial action plan for the Lipari Landfill at Pittman, New Jersey. This is the number one Superfund site in the country and remedial measures are currently underway.

E. Wayne Pearce

- o Waste exploration and remedial action design for a major refinery in Louisiana where over 1 million cubic yards of hazardous wastes have been improperly disposed.
- o Site investigation and analysis of an abandoned chemical dump site in Louisiana. Over 130 coreholes were drilled to sample wastes, soils, and ground water.
- o Various studies which included ground-water modeling activities associated with waste disposal facilities, underground coal gasification, and water supply projects. Modeling experience with both advection/dispersion models and mass-transport models.

For hazardous waste site investigations, Mr. Pearce has played a key role in developing safety plans and selecting appropriate safety equipment. This equipment includes full- and half-face respirators, positive pressure air-supplied suits, self-contained breathing apparatus, passive and active personnel monitoring (dosimeters), and a wide range of support equipment.

At Geraghty & Miller, Mr. Pearce served as a hydrogeologist on contamination studies and water supply projects. These included:

- o A major chemical contamination in Michigan;
- o Red mud contamination at an alumina-bauxite facility in Jamaica;
- o Water supply for an electric generating station in Puerto Rico;
- o Installation of five municipal effluent disposal wells for the City of West Palm Beach (up to 72" diameter wells - 3700 feet deep);
- o Salt water intrusion studies in Florida; and
- o Various other hydrologic studies.

PROFESSIONAL ACTIVITIES:

National Water Well Association, Technical Division; Certified Professional Geological Scientist, American Institute of Professional Geologists #6164.

WILLIAM M. LITTLE

EDUCATION:

M.S., Civil Engineering, University of California, Berkeley, 1974.

M.S., Hydrology, University of Arizona, Tucson, 1968.

B.S., Hydrology, University of Arizona, Tucson, 1967.

EXPERIENCE:

Senior Engineer and Group Leader, Radian Corporation, Austin, TX, 1982-Present.

Senior Engineer, Radian Corporation, Austin, TX, 1978-1982.

Hydrologist, U.S. Army Environmental Hygiene Agency, 1973-1978.

Research and Technical Operations Officer, U.S. Army Engineer Nuclear Cratering Group, 1969-1971.

Graduate Student in Research, University of Arizona, Tucson, 1968.

FIELDS OF EXPERIENCE:

Mr. Little is a Senior Engineer and Group Leader with a major technical specialty in ground-water pollution studies. He is currently the Project Director for hydrogeologic investigations of multiple waste disposal sites on Tinker Air Force Base, Oklahoma. He has recently completed a similar investigation for Kelly AFB, Texas. These investigations include monitoring well construction, ground-water sampling, and contaminant transport assessment. He is responsible for program design and execution, subcontractor selection, and managing and editing the final report. He is also providing technical consulting and expert witness services for a hazardous waste site cleanup case in Kansas City, Missouri.

Mr. Little has recently completed a hydrogeologic investigation of a Superfund site in western New York state. The project included monitoring well construction, definition of ground-water flow system, assessment of contaminant transport potential, and presentations to regulatory authorities. Mr. Little served as Project Director and principal investigator. He has also served as Project Director and field manager for a large, multidisciplinary characterization of an abandoned hazardous waste disposal site in southern California. The waste materials consist of acid petroleum refinery sludges. Major areas of investigation were: chemical characterization of wastes and geologic materials; quantification of sulfur dioxide and hydrocarbon emissions; and ground-water monitoring. Mr. Little was responsible for managing the field operations and supervising report preparation.

02/08/85

RADIAN

corporation

William M. Little

Mr. Little has served as assistant Project Director and field manager for an investigation of the ground-water quality impact of a spill of a coal-distillate liquid at an SRC pilot plant near Tacoma, Washington. The study involved detailed unsaturated zone coring and designing and constructing a series of ground-water monitoring wells. A Remedial Measures Plan was formulated and adopted to remove contaminated materials and to prevent the further spread of ground-water contamination. Following the evaluation of the spill event, Mr. Little directed an expanded program to evaluate the ground-water quality effects of overall plant operations. The possible sources of contamination were identified and characterized. Mr. Little then developed a ground-water monitoring program and supervised the installation of the monitoring network. He designed and conducted aquifer pump tests to define aquifer performance and interpreted the results.

Mr. Little has also conducted a program to evaluate the extent of ground-water contamination by refinery operations and wastes at an oil refinery near Duncan, Oklahoma. The assessment was based on site reconnaissance, interviews with refinery personnel and a study of existing hydrogeologic and process data.

Mr. Little has recently completed two environmental/regulatory fatal flaw studies for lignite mines and associated power plants in East Texas. He was both Project Director, responsible for overall management and preparation of the final report, and hydrology task leader, responsible for assembling data on hydrologic conditions and assessing probable impacts. He has also recently served as task leader for regulations review, impact analysis and permit application preparation for a commercial-scale coal gasification facility in Wyoming and ground-water hydrology task leader for environmental analysis of a major lignite mine and associated synfuels plant in east Texas.

In another program, Mr. Little directed an evaluation of surface-water and ground-water availability in the vicinity of the proposed Solvent Refined Coal-II (SRC-II) demonstration plant and commercial facilities near Morgantown, West Virginia.

For a private industrial client, Mr. Little reviewed and evaluated the environmental monitoring data from the vicinity of an in situ coal gasification test in the Powder River Basin of Wyoming. The water quality impacts of the test burn were assessed, and a program of aquifer restoration and hydrologic testing recommended. Based on available hydrologic and geochemical data, a conceptual model of the test site was developed. He also developed a ground-water monitoring and contingency aquifer restoration program for a proposed future test. The program includes selection of well locations and parameters for monitoring and specification of restoration strategies.

Mr. Little has also participated in an assessment of the environmental behavior of fluidized bed combustion (FBC) waste for EPA, IERL. Mr. Little was responsible for the design, construction and operation of field cells for

02/08/85

William M. Little

testing FBC waste disposal alternatives and for the development of a preliminary waste transport model. He has also been project director and hydrology task leader in the evaluation of the environmental suitability of an ash/scrubber sludge disposal site. He was responsible for the overall management of the program, evaluated the laboratory and hydrogeologic data and predicted contaminant migration.

As a hydrologist with the Water Quality Engineering Division, U.S. Army Environmental Hygiene Agency, Mr. Little served as a consultant to the Office of the Surgeon General and to major commands and installations on hydrologic aspects of water supply and wastewater disposal. He prepared design criteria for programs of effluent and receiving water monitoring at Army manufacturing and research facilities, evaluated ground-water pollution potential of waste disposal practices, and reviewed draft NPDES discharge permits issued to Army installations. He performed preliminary technical feasibility studies of land treatment of wastewater including field investigations and trial systems design. He conducted environmental impact statement data requirements review and prepared and reviewed portions of environmental impact statements. Mr. Little also managed the Army Medical Department's nationwide Drinking Water Surveillance Program.

With the Corps of Engineers, Mr. Little was assigned as a Research and Technical Operations Officer, U.S. Army Engineer Nuclear Cratering Group. There he conducted a general investigation of hydrologic transport of radionuclides from Plowshare application sites. This work included literature searches, computer simulation, experimental design and conceptual modeling of transport phenomena. He also participated in final preparation of a 1971 Corps of Engineers report on Wastewater Management in the San Francisco Bay Region.

While at the University of Arizona, Mr. Little was a member of the Operations Research Study Group on the Tucson Basin, gathering background hydrologic material, and conducting a literature and data file search. He directed and participated in preliminary adaptation of a two-dimensional, finite difference model of a large, heterogeneous ground-water basin.

PETER ALEXANDER WATERREUS

EDUCATION:

B.S., Geology, The University of Texas at San Antonio, San Antonio, TX, 1984.

EXPERIENCE:

Geologist, Radian Corporation, Austin, TX, 1984-Present.

Mud Logger, Precision Well Logging, Houston, TX, 1984.

FIELDS OF EXPERIENCE:

Mr. Waterreus is currently involved in the investigation and determination of a JP-4 fuel leak from existing underground pipelines at Bergstrom AFB, Austin, Texas. As supervising geologist, activities include safety supervision, logging borings, collection of soil samples, installation of monitor wells, collection of water samples, and reporting.

Mr. Waterreus also is currently involved in the investigation of hazardous waste contamination at Sheppard AFB, Wichita Falls, Texas. As a supervising geologist, activities include safety supervision, logging borings, collection of soil samples, installation of monitor wells, collection of water samples, monitoring possible types of contamination by use of a photo-ionizer and drager tubes, and reporting.

Mr. Waterreus was involved in the investigation of environmental impact related to gas and oil production in the Big Thicket area of East Texas. Activities includes delineation and mapping of active and non-active gas and oil well sites as well as damaged areas outside the site area.

At Precision Well Logging, he performed analyses of rock cuttings with respect to lithology and oil content as well as gas monitoring and identification.

He has also been involved in field mapping and property investigation in Uvalde County, Texas.

JENNY B. CHAPMAN

EDUCATION:

M.A., Geology, The University of Texas at Austin, Austin, TX, 1984.

B.S., Geology, Sul Ross State University, Alpine, TX, 1981.

EXPERIENCE:

Geologist, Radian Corporation, Austin, TX, 1984-Present.

Research Assistant, The University of Texas Bureau of Economic Geology, Austin, TX, 1982-1984.

FIELDS OF EXPERIENCE:

At Radian, Ms. Chapman is involved in hydrogeologic and geologic studies, especially as they relate to hazardous waste contamination. Her responsibilities range from collecting and analyzing hydrogeologic and geologic data and samples to interpreting and reporting on the results of investigations.

Ms. Chapman recently participated in a field study at Carswell AFB. She supervised the installation of monitor wells in both alluvial deposits and in the regional aquifer. Drilling methods used include hollow-stem auger, mud rotary, and air rotary. She also supervised geophysical crews and participated in soil and water sampling. She is one of the primary authors of the project report.

Other recent projects include a study funded by the Electric Power Research Institute to locate and collect limestone samples for use in experiments concerning stack scrubber systems. In addition to identifying and collecting the samples, Ms. Chapman participated in laboratory grindability and insoluble residue experiments. In another project, she performed field work at the Big Thicket National Preserve to assess the environmental impact of oil and gas well drilling. Activities included delineation and mapping of active and non-active gas and oil well sites as well as damaged areas adjacent to sites.

At the University of Texas Bureau of Economic Geology, Ms. Chapman wrote and edited contract reports for the West Texas Waste Isolation Project, studying the feasibility of storing high-level radioactive waste in Permian salt beds in the Texas Panhandle. She assisted in hydro- and geochemical research pertaining to WTWI, especially interpreting chemical analyses of water samples.

Ms. Chapman researched and wrote her master degree thesis on the hydrogeochemistry of the unsaturated zone. Her field work included the use of tensiometers, lysimeters, and neutron probes (moisture and density). Lab work included water and soil analysis using atomic absorption spectrophotometer, titration techniques, X-ray diffraction, and thin-section analysis.

JILL P. ROSSI

EDUCATION:

B.A. Geography, The University of Minnesota at Minneapolis, 1972.

EXPERIENCE:

Geographer, Cartographer, Policy and Environmental Analysis Division, Radian Corporation, Austin, TX, 1980-Present.

Drafting and Graphics Assistant, Dam Safety Unit, Texas Department of Water Resources, Austin, TX, 1979-1980.

Cartographer, Continental Map Inc., Austin, TX, 1978-1979.

Teaching Assistant, University College-Geology, University of Minnesota at Minneapolis, 1972.

FIELDS OF EXPERIENCE:

At Radian, Ms. Rossi is responsible for producing maps and coordinating graphics for the Environmental Analysis Division. She utilizes data from a variety of technical disciplines (geology, hydrology, noise and air monitoring, sociology, soils, and hydrogeology) to create maps which clearly and concisely illustrate the written text. Ms. Rossi has been responsible for work in the following projects:

- o Develop base maps and coordinate graphics throughout an Environmental Impact Statement prepared for the U.S. Bureau of Land Management for a central Texas lignite mine;
- o Develop color overlay method of mapping for site selection process of commercial waste disposal sites in Texas and south-eastern Oklahoma;
- o Develop a series of figures used as illustrations in a manual for the Environmental Protection Agency on Remedial Actions at Uncontrolled Hazardous Waste Sites;
- o Draft maps and coordinate the graphics for an Environmental Impact Statement for a synfuels plant in Tennessee;
- o Create base and thematic maps for Air Force Installation Restoration Programs (Phase I and Phase II) for the following locations: Kelly AFB, Texas; Hill AFB, Utah; Bergstrom AFB, Texas; Cannon AFB, New Mexico; England AFB, Louisiana; Tinker AFB, Oklahoma; and Reese AFB, Texas; Carswell AFB, Texas; Sheppard AFB, Texas;

02/07/85

RADIAN
CORPORATION

Jill P. Rossi

- o Map limestone deposits, lime plants, and limestone quarries in the United States by county in a series of regional maps for the Electric Power Research Institute;
- o Map compliance/non-compliance with air pollution standards for all counties in the United States in a series of EPA regional maps;
- o Map concentrations of selected air pollutants in the El Paso, Texas, area for a Texas Air Control Board study in a series of quarterly and annual reports;
- o Prepare aerial photography history of a wood preserving plant for a commercial client which included extensive research of available aerial photography and interpretation of those photos to determine historical features of interest;
- o Prepare complex permitting schedules for proposed mines, energy facilities, and hazardous waste handling facilities;
- o Preparation of base and thematic maps for various feasibility studies, fatal flaw analyses, Environmental Information Documents, and Environmental Impact Statements;
- o Identify, field verify, and map oil and gas development features within the Big Thicket National Preserve for the National Park Service; and
- o Research of available map resources, aerial photography, remote sensing products, and mapping technologies as required by individual client needs.

While with the Texas Department of Water Resources, Ms. Rossi worked in the graphics section of the Dam Safety Unit, a federal grant program. She prepared maps and exhibits, and laid out phototypeset text into camera-ready form according to standards, developed with her assistance, for the technical reports written by the engineering section.

During her employment with Continental Map Incorporated, Ms. Rossi was involved in all phases of four color map production. These included source information procurement and classification, imaging of base maps, scribing plates, cutting specialties, sizing and adhering type, designing customer copy panels, indexing streets and points of interest, photo-lab contact reproducing of base plates, and the final compositing of the four negative plates to be sent to the printer. These maps included large metropolex areas, counties, enlarged downtown sections, and simplified principle city thoroughfares.

02/07/85

RADIAN
CORPORATION

Jill P. Rossi

While employed by the University of Minnesota as a Geology Teaching Assistant, Ms. Rossi taught geology laboratory sessions, prepared geology lab work materials, tutored students, and assisted the professors by preparing classroom presentations and grading and proctoring exams.

	TABLES AND FIGURES	

1.0 INTRODUCTION

This plan describes the safety and health procedures and practices for the accomplishment of IRP Field Evaluation to be conducted at Bergstrom AFB, Texas. All Radian employees and subcontractors to Radian will follow this plan unless situations encountered in the field make changes necessary. These changes must be approved by the Project Director.

Major site activities will consist of pipeline testing, soil coring and monitor well installation and ground water sampling.

The prime responsibility for employee safety will rest with: (1) Radian for it's own employees, (2) Radian subcontractors for their employees and (3) with other parties whose employees will work under Radian's technical direction.

Radian, it's subcontractors, and other parties participating in on-site work, will comply with all applicable requirements of the Occupational Safety and Health Administration. The waste material that will pose a risk to employees is fuel, or more specifically, JP-4 type fuel.

2.0 FIELD ACTIVITIES

The field work will consist of:

- o Pipeline testing
- o Soil coring in the vicinity of building 4544 (Bergstrom Flight Tower)
- o Monitoring well installation
- o Well sampling

2.1 Key Personnel

The Radian personnel who will be responsible for the safe operation of this project are:

- o Program Manager: Tom Grimshaw
- o Project Director: Wayne Pearce and Rick Belan
- o Supervising Geologists: Rick Belan and Peter Waterreus
- o Drilling Supervisor: Robert L. Sherrill and Pat Goodson

The responsibilities of the Project Director with respect to safety are as follows:

- o Locate support facilities in an uncontaminated area.
- o Initiate contact with the Base Safety Officer and test the emergency phone numbers to ensure their accuracy.
- o Implement the site safety training program as described in this plan.
- o Observe site activities to ensure the proper use of personal protective equipment.
- o Initiate outside emergency phone calls when an injury or accident requires medical attention.
- o Ensure that work schedules , dependent on work levels and outside temperatures, are set each day and adhered to though-out the work day.
- o Ensure that the field team observes the work zone and decontamination procedures.
- o Ensure that safety equipment is maintained in a safe manner.
- o Report violation and compliance problems to the Corporate Safety Office in Austin (512-454-4797 ext. 5763, Andrew Ellis).

The responsibilities of the Drilling Supervisor with respect to safety are as follows:

- o Drilling crew compliance with the health and safety plan.
- o Enforcement of corrective action under the direction of the Radian Project Director. Compliance problems will be brought to the attention of the Drilling Supervisor who will be expected to correct the safety problem through a series of reprimands, eventually resulting in the dismissal of the offending employee.

The responsibilities of the Radian Corporate Safety Staff are as follows:

- o Prepare a health and safety plan for the project.
- o Perform a job safety analysis.
- o Select appropriate personal protection equipment.
- o Define appropriate workplace exposure monitoring procedures.
- o Develop of a contamination control program.

- o Develop a plan to cope with anticipated emergencies.

The responsibilities of the field team members are:

- o Read and understand this plan.
- o Perform your work safely.
- o Report any unsafe condition to your supervisor.
- o Be aware and alert for signs and symptoms of exposure to site contaminants.

3.0 JOB SAFETY ANALYSIS

The field work will involve some risk to the employee. The major site hazards are:

- o exposure to petroleum products by way to the skin and respiratory system
- o exposure to physical hazards associated with drilling activities

The personal protective equipment specified below has been selected to reduce the risk of exposure to site hazards.

3.1 Pipeling Testing

Pipeling testing activity will be conducted using up to the personal protective equipment, as determined by the supervising Geologist, listed below:

- o tyvek coveralls
- o Gauntlet style, chemical resistant, neoprene gloves
- o Chemical resistant, steel toed, stell shank, safety boots, (PVC or Neoprene)
- o Respirator, half-face or full-face piece, air purifying, equipped with organic vapor cartridges and dust filters;
- o Safety helmet

3.2 Soil Coring

Soil coring activity will be conducted using the personal protective equipment listed below:

- o tyvek coveralls
- o Gauntlet style, chemical resistant, neoprene gloves
- o Chemical resistant, steel toed, stell shank, safety boots, (PVC or Neoprene)
- o Respirator, half-face or full-face piece, air purifying, equipped with organic vapor cartridges and dust filters;
- o Safety helmet

3.3 Monitor Well Installation

The personal protective equipment listed below will be used during the installation of monitoring wells.

- o tyvek coveralls
- o Gauntlet style, chemical resistant, neoprene gloves
- o Chemical resistant, steel toed, stell shank, safety boots, (PVC or Neoprene)
- o Respirator, half-face or full-face piece, air purifying, equipped with organic vapor cartridges and dust filters;
- o Safety helmet
- o Hearing protection

3.4 Well Sampling

The field team will use the equipment listed below when collecting well samples:

- o tyvek coveralls;
- o Gauntlet style, chemical resistant, neoprene gloves;
- o Chemical resistant, steel toed, stell shank, safety boots, (PVC or Neoprene);
- o Respirator, half-face or full-face piece, air purifying, equipped with organic vapor cartridges and dust filters;
- o Safety helmet; and
- o Hearing protectors (rotary drilling rig).

Depending on site conditions and drilling conditions, other items may be used for supplemental protection. Such items may include:

- o PVC bib overalls and jacket (especially for drillers handling auger flights that have contacted waste material);
- o Respirator, half-face piece, air purifying equipped with organic vapor cartridges and dust filters (used only when where there is no eye irritating chemicals, splashes, or projectiles in the work environment) YOU MUST USE EYE PROTECTION WITH HALF FACE RESPIRATORS;
- o Chemical splash goggles when splash hazards exist (steam cleaning especially); and
- o PVC disposable gloves to be worn outside of the neoprene gloves for extra protection.

3.5 Other Potential Hazards

The site may contain other hazards that are not described above. The Supervising Geologist will make an assessment of the site hazards prior to starting work and ensure that the field team is protected. Two hazards which may be encountered are:

- o heat stress
- o drilling into underground hazards (buried drums, cylinders, electrical cables, etc.)

Heat Stress

During work, the Supervising Geologist must be alert for the signs and symptoms of heat stress. A hazard exists when employees are required to work in warm temperatures while wearing impervious protective clothing. When ambient air temperatures at the site exceed 65 degrees F, heat stress may become a problem. If these conditions are encountered, the following precautions will be taken:

- o The Supervising Geologist will regularly monitor the ambient air temperature;
- o Field team members will be observed for the following signs and symptoms of heat stress:
 - Dizziness
 - Profuse sweating
 - Skin color change
 - Increased heart rate

- Abnormal body temperature as measured by fever detectors (forehead straps)
- vision problems

Any employee who exhibits any of these symptoms will be immediately removed from field work and requested to consume 2-4 pints of electrolyte fluid or cool water every hour while resting in a shaded area. The worker should not return to work until symptoms are no longer recognizable. If the symptoms worsen, seek immediate medical attention.

Drilling Into Buried Hazards

During the planning/mobilization phase, the Supervising Geologist should consult with base personnel about the location of utility lines. Prior to penetrating the soil, ask knowledgeable site employees about the possibility of buried drums or gas cylinders. If drilling cuttings indicate any signs of drums or cylinders, cease drilling immediately and close the bore-hole.

4.0 TRAINING INFORMATION ON HEALTH AND SAFETY PROCEDURES

Drilling operations will expose the field team to a noise hazard and based on previous experience with similar operations, hearing protection will be required for the field team while operating rotary drilling equipment. Some tips to pay attention to when working around drilling rigs are given below:

- o Always wear the proper personal protection as required by the safety plan.
- o Always wear eye protection while working on site. Driving pins in drive chains, handling chemicals, breaking concrete, hammering or sledging, cutting wires, grinding, and or welding are all examples of work that is hazardous to your eyes.
- o Don't set or drop a heavy object on your foot.
- o Use the correct stance when lifting a heavy object.
- o Watch out for slippery surfaces or objects to trip on.
- o Always wear splash goggles when handling chemicals.
- o Keep your clothing out of spinning rig equipment.
- o Always get treatment for even the most minor scratch or abrasion.
- o Watch out for swinging equipment. Most drilling equipment will break a rib if it hits you.

4.1 Health and Safety Training

Prior to starting the work, the Project Director will conduct a training session and ensure that each field team member understands his or her safety responsibilities.

All personnel assigned to drilling activities and water sampling efforts will be instructed regarding the potential health and safety hazards. Specifically, the following topics will be covered in the initial training session.

- o Potential routes of contact with toxic and/or corrosive materials, excessive noise, or physical site hazards.
 - skin contact/absorption
 - eye contact
 - inhalation
 - ingestion
 - hearing exposure
- o Types, proper use, limitations and maintenance of applicable protective clothing and equipment.
 - safety helmet
 - eye protection
 - gloves
 - safety boots
 - tyvek coveralls
 - respirators
- o Respiratory protection using full-facepiece or half-facepiece air purifying respirator equipped with organic vapor cartridges and dust filters
 - forms of respirators: air purifying, air supplied, and self contained
 - selection of respiratory protection based on the hazard
 - NIOSH certification of all equipment to be used on site
 - medical/physical fitness to wear respiratory protection
 - use, limitations and maintenance of full and half-face respirators including qualitative fit testing, routine inspection, replacement of parts, cleaning, disinfection, decontamination, and storage requirements.
- o Proper decontamination procedures and adherence to work zone boundaries.
- o Reporting of accidents and availability of medical assistance.

4.2 Potential Routes of Exposure

Field team members can be exposed to a number of hazards on the site. Based on preliminary information, the following hazards and routes of exposure are known to be present.

- o fuels: respiratory hazard, ingestion hazard;

- o excessive noise: auditory hazard; and
- o drilling rigs: physical, eye, head, hand hazards.

4.3 Personal Protective Clothing and Equipment

Workers on site will use protective clothing and equipment to reduce or eliminate the risk of exposure to the hazards mentioned above. Workers will be trained in the proper use of such clothing and equipment before starting work.

Clothing

Protective coveralls will reduce the chances of contacting the waste material. The Tyvek coverall will provide protection against splashes, and dusts. The coveralls are not to be considered "impervious" and should be quickly removed upon obvious contamination.

Gloves

Gloves provided for this project will protect the hands from contacting the waste material. The Gauntlet style neoprene glove is used for handling grossly contaminated equipment and soil samples. The PVC disposable glove is used for routine site work, and should be considered "light duty" gloves. The PVC gloves will not provide a high level of protection against contaminated ground or surface samples, and may only be used when the chance of contact with these materials is unlikely. They should be removed and disposed of immediately upon contamination.

Eye Protection

Several levels of eye protection are available for this project. The full-facepiece respirator will provide eye protection against splashes and eye irritating gases and mists. Splash goggles will be used when steam cleaning equipment. Every team member will use proper safety glasses while on site.

Respiratory Protection

The respirators selected for this project will provide protection against anticipated levels of airborne gases, fumes, mists, and dusts. To ensure that the mask will perform as expected, the respirator must be inspected, fit tested, maintained, and stored properly, according to company policy and governmental regulations.

1. Inspection procedures:

The face-piece (full or half) should be free of dust, dirt, rips, tears, and obvious contamination. The septa (three in

the half-facepiece, one in the full-facepiece) should be present and in good shape, watch for rips or dirt.

2. Fit Testing Procedures:

The first step in testing the fit of your respirator is called the negative pressure test. Block the inhalation valves (on the side of the mask) with the hands or plastic sheets and inhale slightly. You should feel the mask draw in on the face. Watch for air leakage around the face-piece indicating a poor facial fit. REMEMBER, NO FACIAL HAIR THAT INTERFERES WITH THE FIT OF THE MASK IS PERMITTED.

The next test (positive pressure test) is done by blocking the exhalation valve (at the bottom of the mask) with the palm of your hand. Exhale gently and notice for air leaking around the face-piece of the mask, indicating a poor fit. If air is leaking out of the mask, re-tighten the straps and perform the negative and positive pressure tests again.

The last test (qualitative testing) involves the use of an indicating odor that is passed around the mask fitted with ORGANIC VAPOR CARTRIDGES. The employee will be asked to position his or her head to the side, up and down to simulate normal working conditions. The detection of the odor indicates that the facial seal of the mask is inadequate. If the employee detects the smell, the trainer is allowed to tighten the straps and adjust the mask on the employee one time. If the odor test is unsuccessful twice, another brand of mask should be fitted.

3. Maintenance of Respirators:

Respirators will be maintained to ensure that they work properly. Replace any missing part of the mask or strap, clean the mask with hot soapy water after each use, and do not let others wear your mask without disinfection first.

4. Storage of Respirators:

Respirators must be stored in a clean, safe, dry, environment (e.g. not near the working area or on the drilling rigs).

5. Use and limitations of Respirators:

Respirators selected for this project should be used properly and within the limits for which they were designed. These air-purifying respirators will be useful in concentrations well below the 1000 ppm filtration limit of the cartridges. Air monitoring will confirm that airborne contamination does not exceed the use limitations of the respirator. These masks do

not provide oxygen and should not be used in confined spaces or oxygen deficient atmospheres.

4.4 Decontamination and Work Zone Procedures

Items that become contaminated must be cleaned up to prevent employee exposure and the spread of harmful materials. The field team will also be expected to establish work zones and comply with safety procedures and dress codes for each particular zone. Section 6 gives a description of the decontamination procedures that will be used for this project. The following information will be given to the field team.

- o Work zone definition and marking;
- o Dress codes for each work zone;
- o Decontamination procedures for personnel, equipment, and heavy equipment.

Exclusion Zone

The exclusion zone is the area immediately surrounding the work area where the waste is being disturbed. For Monitor Well installation (hollow-stem and air rotary) the exclusion zone will comprise a circle extending 25 feet around the drilling rig. Proper personal protection consists of hand, foot, eye, respiratory, body, and head protection as listed in Section 3.2.

Contamination Reduction Zone (CRZ)

The contamination reduction zone is the area where decontamination will occur. The idea is to have personnel remove contaminants from themselves and their equipment inside the CRZ. This practice will avoid the spread of contamination into the support area.

Support Zone

The support zone is intended as an area that remains free of contamination and is used for staging activities, breaks, and eating. It is extremely important to keep this area clean and free of contamination. Never bring contaminated equipment, articles or yourself into this area without going through the decontamination procedures first.

Decontamination Procedures

Personnel and equipment can become contaminated in a number of ways including:

- o Contacting vapors, gases, mists, or particulates in the air.

- o Being splashed by materials while sampling or opening containers.
- o Walking through puddles of liquids or on contaminated soil.
- o Using contaminated instruments or equipment.

Protective clothing and respirators help prevent the wearer from becoming contaminated or inhaling contaminants. Good work practices help reduce contamination of protective clothing, instruments, and equipment.

The employee needs to be aware of donning and doffing procedures for protective clothing and equipment. These procedures are easy to follow:

- o Gloves go on your hands first when putting protective clothing on; and
- o Gloves come off your hands last, when undressing.

These procedures will be supplemented by performing decontamination on personnel, equipment and heavy equipment. Decontamination procedures consist of physically removing contaminants from the person or equipment with:

- o Steam cleaning equipment;
- o Diesel fuel and brushes;
- o Acetone rinsing; and
- o Detergent washing.

The drilling rig will be steam cleaned following contact with waste/soil material. The rig will then be spray washed and detergent washed prior to leaving the CRZ. Diesel fuel brushing is only required in the event that the auger flights become covered with waste that the steam cleaning will not remove.

Respirators should be washed with detergent/disinfection solution to remove any contamination. Respirators must be washed at the end of each day or more often if they become grossly contaminated.

Emergency Procedures

Emergency procedures are presented in this manual to address the possible site emergencies given below:

- o Medical injuries;
- o Fire and explosions;

- o Excessive emissions from drilling activity;

Medical Injuries

Medical problems that can occur on site need to be handled competently and quickly. Each field team member should be aware of the instructions and information given below:

- o Write down and post the telephone numbers of the local Base and community ambulances and medical facilities.
- o Seek professional medical attention for personnel that are not breathing, bleeding severely, experiencing intense pain or are unconscious. Each member of the site team should know how to call for an ambulance (on Base and off Base).
- o If you get anything in your eyes (chemicals or dust), flood them with water for 15 minutes. Be sure to tell a supervisor. The Supervisor will make sure that the victim washes the eyes for the full 15 minutes.
- o Do not remove objects that are impaled (stuck) in the eye.
- o Always seek medical attention for eye injuries.
- o Stop bleeding with direct pressure. Place a bandage over the wound and press down with your hand. Use a tourniquet only in extreme cases when you are not able to stop severe bleeding.
- o If you contact the waste, wash the affected area with soap and water as soon as possible. If large amounts of waste come in contact with the body, you will be required to take a full body shower with soap immediately.

Fire and Explosion Response Procedures

Fires on site can be caused by the drilling rig activity and welding activity. The drilling rig will have a fire extinguisher on hand at all times. The procedure for using a fire extinguisher is to pull the safety pin, point the extinguisher at the base of the flames and discharge the extinguisher by sweeping the flames from a distance of six feet. Move in closer as the flames are being put out.

- o Never use water on an electrical fire or a solvent fire. All extinguishers should be dry chemical and labeled "Class A, B, C".
- o Never weld in dry grass and always keep an extinguisher nearby.

- o Keep decontamination solvents well away from the steam cleaner.

Excessive Emissions Procedures

If the detector tube readings indicate that the drilling activity is producing excessive emmisions (any emission approaching the TLV), the following action needs to be taken:

- o Cease drilling and contain cuttings.
- o If emissions are not controlled, remove auger flights and close the borehole. Continuous air monitoring will be conducted during this type of emergency.
- o Be prepared to evacuate to an upwind site.

5.0 DECONTAMINATION PROCEDURES

To minimize the transfer of hazardous substances from the site, contamination control procedures are needed. Contaminants must be removed from people and equipment prior to relocation from a work zone.

5.1 Work Zones

The field team will prevent waste material from moving from the drilling site. The team will prevent migration of site contaminants by using work zones to control the spread of contamination. Decontamination procedures will also help reduce the chances of spreading contaminants.

Exclusion Zone

A 25 foot circle around the drilling site will be defined before drilling starts. The circle will constitute the "Exclusion Zone". This zone may contain potentially hazardous airborne and physical hazards to the workers. Full personal protection will be required in this area.

Contamination Reduction Zone

A corridor leading from the exclusion zone will be defined. This corridor should lead from the drilling rig to the break area. All de-contamination activities will occur in this area. A waste container should be placed at the end of the corridor so contaminated disposable equipment can be dropped off.

Support Zone

A support zone must be defined for each well installation location. The zone should be at least 50 feet from the drilling rig and should be clean and free of contamination (surface and airborne). Air monitoring and visual

inspection of the support zone location will confirm that the area is relatively clean.

5.2 Personal Hygiene Requirements

Some general rules to obey when in the support zone are as follows:

- o You must wash your hands and forearms with soap and water before eating, drinking, smoking, anything.
- o You must wash your hands before using the toilet.

Remove personal protective equipment in the order given below while in the decontamination corridor.

- o first, remove any outer gloves or boot covers and drop them in the container provided
- o remove the tyvek coverall, save this coverall unless it is contaminated
- o remove your respirator
- o last, remove your inside gloves

Reverse the order of the doffing procedure when you are ready to re-enter the exclusion zone.
